#### Do the benefits of the influenza vaccine outweigh the risks?

Every year in the United States, influenza kills thousands to tens of thousands of people. Probably the best example of how devastating influenza can be was the influenza pandemic in 1918 — this worldwide outbreak killed between 50 and 100 million people in a single influenza season.

Influenza vaccine protects against the four influenza virus strains expected to circulate during influenza season. Some years the vaccine strains are not as good of a match with the circulating strains as we would like. In these cases, people who were vaccinated may still get influenza. For most of them, their disease will be less severe and shorter than if they had not been vaccinated.

The influenza vaccine can cause mild side effects. On the other hand, influenza typically hospitalizes and kills more people in this country than any other vaccine-preventable disease — about 200,000 hospitalizations and thousands to tens of thousands of deaths occur every year. Therefore, the benefits of the influenza vaccine clearly outweigh its risks.

**Disease risks include:** high fever, chills, severe muscle aches, pneumonia, runny nose and coughing for weeks, disease can be fatal.

**Vaccine risks include:** pain, redness and swelling at the injection site, fever, muscle aches.

#### ¿Los beneficios de la vacuna contra la influenza superan los riesgos?

Cada año en los Estados Unidos, la influenza mata de miles a decenas de miles de personas. Probablemente el mejor ejemplo de cuán devastadora puede ser la gripe fue la pandemia de gripe en 1918 - este brote mundial mató entre 50 y 100 millones de personas en una sola temporada de gripe.

La vacuna contra la influenza protege contra las cuatro cepas del virus de la influenza que se espera que circulen durante la temporada de influenza. Algunos años, las cepas de la vacuna no coinciden tan bien con las cepas circulantes como nos gustaría. En estos casos, las personas que fueron vacunadas aún pueden contraer influenza. Para la mayoría de ellos, su enfermedad será menos grave y más corta que si no hubieran sido vacunados.

La vacuna contra la influenza puede causar efectos secundarios leves. Por otro lado, la influenza generalmente hospitaliza y mata a más personas en este país que cualquier otra enfermedad prevenible por vacunación - alrededor de 200,000 hospitalizaciones y miles a decenas de miles de muertes ocurren cada año. Por lo tanto, los beneficios de la vacuna contra la gripe superan claramente sus riesgos.

**Los riesgos de enfermedad incluyen:** fiebre alta, escalofríos, dolores musculares severos, neumonía, secreción nasal y tos durante semanas, la enfermedad puede ser fatal.

**Los riesgos de la vacuna incluyen:** dolor, enrojecimiento e hinchazón en el sitio de la inyección, fiebre, dolores musculares.
