- Russian River Health Center (707) 869-2849
- Kaiser Permanente (707) 393-4044

Too Many Vaccines?

Are children getting more vaccine than their little bodies can handle?

Question: How many vaccines can children effectively handle at one time?

Answer from the Vaccine Education Center at Children’s Hospital of Philadelphia: **“A lot more than they’re getting now.** The purpose of a vaccine is to prompt a child’s body to make antibodies, which work by preventing bacteria and viruses from reproducing themselves and causing disease. So, how many different antibodies can babies make? The best answer to this question came from a Nobel Prize-winning immunologist at the Massachusetts Institute of Technology. People can make about 10 billion different antibodies. It is calculated that given the number of antibody-producing cells in a child’s bloodstream and the number of immunological components contained in vaccines, babies could effectively respond to about 100,000 vaccines at one time. Although this number sounds overwhelming, remember that every day children are defending themselves against a far greater number of immunological challenges in their environment. The difference is that while we are aware of immunologic challenges from vaccines, we are unaware of the challenges encountered during every day activities.”

¿Demasiadas Vacunas? ¿Están recibiendo los niños más vacunos de las que sus pequeños cuerpos pueden soportar?

Pregunta: ¿Cuántas vacunas pueden manejar los niños de manera eficaz al mismo tiempo?

Respuesta del centro de educación de vacunas del hospital de niños de Philadelphia: **“Mucho más de lo que obtienen ahora.** El propósito de la vacuna es hacer que el cuerpo de un niño produzca anticuerpos, que funcionan evitando que las bacterias y los virus se reproduzcan y causen enfermedades. ¿Entonces, cuántos anticuerpos diferentes pueden producir los bebés? La mejor respuesta a esta pregunta provino de un inmunólogo ganador del Premio Nobel en el Instituto de Tecnología de Massachusetts. Las personas pueden producir alrededor de 10 mil millones de anticuerpos diferentes. Se calcula que, dada la cantidad de células productoras de anticuerpos en el torrente sanguíneo de un niño y la cantidad de componentes inmunológicos contenidos en las vacunas, los bebés podrían responder eficazmente a unas 100,000 vacunas al mismo tiempo. Aunque este número suena abrumador, recuerde que todos los días los niños se defienden de un número mucho mayor de desafíos inmunológicos en su entorno. La diferencia es que, si bien somos conscientes de los desafíos inmunológicos de las vacunas, no somos conscientes de los desafíos que encontramos durante las actividades diarias.”
