- Russian River Health Center (707) 869-2849
- Kaiser Permanente (707) 393-4044

#### What is tetanus and why is tetanus vaccination (DTaP) important?

Tetanus is a disease caused by a toxin-releasing bacterium, Clostridium tetani. Unlike most vaccine-preventable diseases, tetanus is not a disease that you catch from someone else. The bacteria live in the soil and usually enter the body following punctures or wounds that are not kept clean or include damaged tissues such as from burns, frostbite, or gangrene. Given the playful, adventurous, and oftentimes injury-prone nature of children, it's important to immunize them against tetanus. Hand washing and bathing do little once the bacteria actually get under the skin.

Once under the skin, the bacteria make a toxin that causes muscle spasms. If these spasms affect the throat and jaw (lockjaw), they can interfere with breathing, causing suffocation. The tetanus toxin can also damage the heart. Further, people cannot be protected from this disease because everyone around them has had a vaccine; that is, there is no protection from herd immunity.

#### Two populations most affected by tetanus

In developed countries, tetanus is typically thought of as infecting wounds in adults who have injured themselves; however, in the developing world many infants suffer from neonatal tetanus. Infections in newborns result from poor sanitation either during or after delivery. Efforts to eliminate infant deaths from tetanus are making progress, but work remains to be done.

#### ¿Qué es el tétanos y por qué es importante la vacunación contra el tétanos (DTaP)?

El tétanos es una enfermedad causada por una bacteria liberadora de toxinas, Clostridium tetani. A diferencia de la mayoría de las enfermedades prevenibles por vacunación, el tétanos no es una enfermedad que se contrae de otra persona. Las bacterias viven en el suelo y generalmente ingresan al cuerpo después de punciones o heridas que no se mantienen limpias o incluyen tejidos dañados, como quemaduras, congelación o gangrena. Dada la naturaleza juguetona, aventurera y a menudo propensa a lesiones de los niños, es importante vacunarlos contra el tétanos. Lavarse las manos y bañarse hacen poco una vez que las bacterias realmente se meten debajo de la piel.

Una vez debajo de la piel, las bacterias producen una toxina que causa espasmos musculares. Si estos espasmos afectan la garganta y la mandíbula (trismo), pueden interferir con la respiración, causando asfixia. La toxina tetánica también puede dañar el corazón. Además, las personas no pueden protegerse de esta enfermedad porque todos a su alrededor han recibido una vacuna; es decir, no hay protección contra la inmunidad colectiva.

#### Dos poblaciones más afectadas por el tétanos

En los países desarrollados, el tétanos se considera típicamente como la infección de heridas en adultos que se han lesionado; Sin embargo, en el mundo en desarrollo muchos niños sufren de tétanos neonatal. Las infecciones en los recién nacidos son el resultado de un saneamiento deficiente, ya sea durante o después del parto. Los esfuerzos para eliminar las muertes infantiles por tétanos están progresando, pero queda trabajo por hacer.
