INTRODUCTION

Through Chapter 36 of the Sonoma County Code (code), – New Vineyard and Orchard Development, Vineyard and Orchard Redevelopment, and Agricultural Grading and Drainage Alteration (VESCO) – the Land Stewardship Division (Division) of the Sonoma County Department of Agriculture/Weights & Measures regulates new vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration in order to minimize and control potential impacts to the surrounding environment due to agricultural activities in Sonoma County. In the context of this manual, that includes the design and implementation of plans that minimize soil erosion and the mobilization of sediment into streams and other bodies of water during new vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration. Erosion and sedimentation are most successfully managed through the implementation of various BMPs during each stage of the project. Through proper planning and the implementation of the best management practices (BMPs) outlined in this manual, both temporary and permanent impacts can be managed throughout the stages of development work, as required by VESCO.

I. Manual Purpose and Scope

This manual is designed to provide general guidance for implementing BMPs that will eliminate or reduce the erosion of soil and the mobilization of sediment from new vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration projects in accordance with the standards set by Article 18 of Chapter 36 of the code. This manual also provides guidelines for preparing professional reports and describes when they are required.

This manual provides BMPs for the Project Planning and Initial Design, Project Design, and Project Construction of new vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration.

Once a vineyard or orchard is planted or replanted, The Land Steward’s Guide to Vineyard and Orchard Erosion Control, also prepared by the Division, is a guide to assist vineyard and orchard operators on general principles of erosion control.

II. Manual Organization

Chapter 1: Project Planning and Initial Design
BMPs for each phase of project implementation. The BMPs in Chapter 1 of this manual are described in the subsequent chapters.

Chapter 2: Project Design – Agricultural Drainage Alteration
BMPs for constructed drainage systems, as well as those used to configure site drainage patterns to limit post-development stormwater runoff and erosion.

Chapter 3: Project Design – Agricultural Roads and Avenues
BMPs for the design of agricultural roads and avenues to minimize erosion and control sediment.
Chapter 4: Project Design – Tree Removal

Applies to projects proposing the removal of more than one-half acre of tree canopy or which already removed more than one-half acre of tree canopy since November 2008.

Chapter 5: Project Construction

Describes the erosion and sediment control practices recommended to be implemented during any work that may cause earth disturbance, including new vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration work.

These chapters are followed by the following appendices:

- Appendix 1: Geologic Report Guidelines
- Appendix 2: Geotechnical/Soils Report Guidelines
- Appendix 3: Drainage Report Guidelines
- Appendix 4: Biotic Resource and Focused Species Assessment Guidelines
- Appendix 5: Wetlands Report Guidelines
- Appendix 6: Reference Materials for USLE Calculations
- Appendix 7: Glossary
- Appendix 8: Standard Notes
CHAPTER 1 – PROJECT PLANNING AND INITIAL DESIGN

Prior to beginning any earth-disturbing work, all stages of the project must be planned to minimize soil erosion and the mobilization of sediment into streams and other bodies of water. This includes incorporating the BMPs described in this manual into the planning, design, and construction of a project. This chapter will assist with planning the details of a project by outlining the BMPs required to be implemented throughout the project development process, while the subsequent chapters provide details on each BMP.

I. Step 1 – Define Project

The first step in project planning is to clearly define the conceptual scope and physical boundaries of the project.

II. Step 2 – Review and Evaluate Site Features

Key site features that must be evaluated, shown on plans, and their proper management incorporated into site design include, at a minimum:

- Soil Type(s)
- Soil Conditions
- Ridgetops
- Hydrologic Patterns
- Lakes/Ponds
- Springs
- Vegetation/Trees
- Property Lines
- Reservoirs
- Wetlands
- Areas of instability
- Setbacks
- Watercourses/Riparian Areas
- Existing Roads and Access
- Drainage System
- Slope Gradient/Orientation

In order to determine the existence and extent of many of these features and their association with a proposed new vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration, technical reports may be required. Refer to Appendices 1-5 of this manual for guidelines on preparing professional reports to inform the proposed project.

III. Step 3 – Select BMPs

For BMPs to be effective in controlling nonpoint source pollution, they must be properly designed, sited, installed, and maintained. Proper design includes making sure the selected BMP will achieve the desired result. The BMP should be sited in the best location to achieve maximum pollutant removal and installed in such a manner that it will function properly. BMP structures which are not maintained will most certainly fail.

A. BMPs for Project Design

The following BMPs are required to be implemented into the design of Drainage Alteration, Agricultural Road Network, and Tree Removal projects, as shown in Table 1, below, in order to minimize soil erosion and the mobilization of sediment from a project area, achieving permanent erosion and sediment control. The BMPs are prescribed per project type, below, and detailed in Chapters 2-4 of this manual. When properly installed and maintained, these BMPs will limit post-development stormwater runoff and the discharge of soil and other pollutants, as required by Sections 36.18.030.A. and 36.18.130. of the code.
While not identified explicitly in Table 1, below, it should be understood that new vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading projects involving any of the project types listed below must additionally incorporate the required BMPs into project design, as applicable.

**B. BMPs for Project Construction**

Regardless of the project type, the following BMPs must be implemented during project construction to limit the potential for erosion and the transport of sediment and other pollutants during construction. The BMPs required to be implemented are dependent, in part, on the phase of the project, as explained in Chapter 5 of this manual.

As always, retain the services of a professional when contemplating engineered solutions.

**IV. Step 4 – Execute Project**
CHAPTER 2: PROJECT DESIGN – AGRICULTURAL DRAINAGE ALTERATION

As defined in Chapter 36 of the code, drainage systems are constructed and/or natural features that work together to collect, convey, channel, hold, inhibit, retain, detain, infiltrate, divert, treat, or filter stormwater runoff, including detention and retention basins, overland flow paths, pipes, channels, and the inlets and outlets to these features.

These drainage systems, excluding those involving agricultural roads and avenues which are covered in Chapter 3 of this manual, shall be designed in accordance with this chapter and Sections 36.18.030 and 36.18.130.C. of the code to maintain natural and existing drainage patterns, maximize infiltration, minimize erosion, and limit the discharge of soil and other pollutants.

It must be noted that while this chapter details BMPs to be incorporated into the design of drainage facilities and systems, the erosion and sediment control BMPs described in Chapter 5 of this manual are to be implemented during the construction of agricultural drainage facilities and systems.

I. Drainage Patterns and Runoff

In accordance with Section 36.18.030.A. of the code, all new vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration shall be designed and constructed to maintain natural and existing drainage patterns and limit post-development stormwater runoff. Drainage alterations shall not increase the total amount of runoff in a given tributary area.

II. Drainage Activities Exempt from Permit Requirements

Certain drainage alteration activities, such as minor pipe and vee-ditch swale systems, may be conducted without obtaining an agricultural drainage alteration permit, provided the activities comply with the standards in Article 18 of the code and incorporate the BMPs described in this manual into final design.

A complete and detailed list of the drainage alteration activities exempt from permit requirements can be found in Section 36.10.010.C of the code.

III. Existing Drainage Facilities and Systems

While not permitted by the Department of Agriculture, existing drainage systems will be reviewed with VESCO applications to ensure compliance with the standards of Chapter 36 of the code.

A. Review Existing Conditions

Check existing inlets and outlets for signs of erosion and deposition of sediment. Table 3, below, lists potential corrective actions to be implemented to correct observed deficiencies of the existing drainage system. Any modifications to the existing drainage system shall be completed in accordance with the following sections of this chapter.
### Table 3. BMPs to be Implemented During Project Construction for Temporary Erosion and Sediment Control

*Note: The Department of Agriculture is not the permitting agency for areas located within the jurisdiction of state and federal resource agencies. If it is determined that an existing drainage system located within the jurisdiction of state and federal resource agencies requires modification, consult with the PRMD.*

#### B. Prepare Drainage Analysis

When proposing to expand the tributary of an existing drainage system, analysis must be provided that the existing system has adequate capacity to handle the increased flows. This analysis shall be prepared in accordance with the Drainage Report Guidelines in Appendix 3 of this manual and include an analysis of all components of the drainage system, both existing and proposed. If an existing drainage system is found to be undersized for the design flow, a hydraulic and erosion analysis must be provided for overland flow of the excess water. In addition, existing drainage systems that discharge to a stream must demonstrate that the drainage system will not cause downstream erosion.

#### IV. Design of Drainage Facilities and Systems

Drainage systems designed to manage stormwater runoff shall be designed to encourage overland sheet flow, utilizing existing natural features to convey stormwater flows whenever possible.

##### A. Overland Sheet Flow

Where overland sheet flow is a selected drainage pattern, an analysis of pre- and post-development sheet flow shall be provided in accordance with the Drainage Report guidelines presented in Appendix 3 of this manual, or an alternative published and peer reviewed method. The sheet flow analysis must determine if and when overland sheet flow will become shallow concentrated flow. Flow velocities which exceed 5 cubic feet per second (cf/s) on non-highly erodible soils or 3 cf/s on highly erodible soils are considered to be erosive and must be redirected/redesigned to control erosion.

##### B. Constructed Drainage Systems

Constructed drainage systems are generally comprised of the following three components: inlets, conveyance, and outlets. Should a constructed drainage system be selected for the proposed development, vegetated swales are encouraged over-use of pipes. The following BMPs shall be incorporated into plans for drainage alteration when any of these components are proposed.
1. Inlets

Where stormwater runoff is conveyed in a constructed drainage system that utilizes inlets to collect surface runoff, inlets shall be designed to limit surficial erosion and prevent the discharge of sediment. To limit erosion, inlets shall be spaced such that runoff is captured before flows concentrate to a potentially erosive level. Flow velocity can be determined using the method presented in the Drainage Report guidelines in Appendix 3 of this manual. To limit the discharge of sediment, inlets are to contain a sediment collection component, such as a sediment collar, to collect entrained sediment prior to flows entering the conveyance facility. A sediment collar consists of a corrugated plastic pipe collar placed around the pipe.

The accepted method to size and install a sediment collection device includes the following steps:

- Specify the material type
- Specify the horizontal dimensions
- Max cut-slope gradient for sediment trap sidewalls is 2:1 which will affect horizontal dimensions. Show horizontal dimensions for 15-45% slopes
- Increase elevation difference between drainpipe and sediment collection sump inlets from 3 to 6 inches
- The collection area (sump) must be a minimum of 6 inches deep.

If an alternative method is utilized to size and install a sediment collection device, it must be shown that the alternative method meets the minimum criteria.

2. Conveyance Facilities

Conveyance facilities are used to divert stormwater runoff from the surface and convey it to a stabilized outlet. Those that are primarily utilized for agricultural drainage alteration include surface interceptor drains and rock or grass-lined swales. Conveyance facilities such as surface interceptor drains do not control erosion and the movement of sediment, however they prevent erosion by directing runoff to a stable outlet and/or by directing runoff away from erodible areas. Drainage facilities and systems are required by Section 36.18.030.B.1. of the code to be designed for no less than the 25-year design discharge, as defined in the Sonoma County Flood Control Design Criteria.
i. Rock or Grass-Lined Swales

A constructed swale is a shaped and sloped depression in the soil surfaced designed to collect stormwater runoff and convey it to a stable outlet. Swales are to be armored with rock or lined with grass or a geotextile or mat described in Chapter 5 of this manual, to prevent the erosion of newly-graded surfaces.

3. Outlets and the Disposal of Stormwater Runoff

As conveyance facilities increase concentrated flows and increase flow velocities, outlets must be designed to reduce flow velocity of stormwater exiting the conveyance facility before it is discharged and minimize the potential for scouring and erosion. Depending on the flow velocity exiting a conveyance facility, numerous discharge points may be needed to avoid the erosive effects from discharge of concentrated flow. It should be noted that sub-drain outfall locations must also be reviewed for compliance with the standards of Chapter 36 of the code.

As prescribed by Chapter 36 of the code, all new vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration, including drainage system outlets, is required to maintain setbacks. Direct discharge to creeks, streams, neighboring parcels or County rights-of-way is also prohibited.

The two outlets typically used in agricultural drainage systems are velocity dissipation devices and sediment basins, as described below.

i. Velocity Dissipation Devices

Velocity dissipation devices require the placement of rock, riprap, or other material at the outlet of the conveyance facility to reduce flow velocity of existing storm water discharge. Rock outlet protection serves to trap sediment and reduce flow velocities and is usually less expensive and easier to install than concrete aprons or energy dissipaters. While there are many types of materials that can be used for velocity dissipation devices, best results are obtained when sound, durable, and angular rock is used.

As with most channel design projects, depth of flow, roughness, gradient, side slopes, discharge rate, and velocity must be considered in the outlet design. General recommendations for rock size and length of outlet protection are shown in Table 4, below, and should be considered minimums. The apron length and rock size gradation are to be determined using a combination of the discharge pipe diameter and estimated discharge rate. It is important to select the longest apron length and largest rock size suggested by the pipe size and discharge rate. For larger or higher flows than those shown in the table below, consult a civil engineer.

Where flows are conveyed in open channels such as v-ditches and swales, use the estimated discharge rate for selecting the apron length and rock size. Flows should be the same as the culvert or channel design flow but
never less than the peak 5-year flow for temporary structures planned for one rainy season, or the 10-year peak flow for temporary structures planned for two or three rainy seasons.

</tbody>
</table>

Carefully place riprap to avoid damaging the filter fabric. Stone 4 inches to 6 inches may be carefully dumped onto filter fabric from a height not to exceed 12 inches. Stone 8 inches to 12 inches must be hand placed onto filter fabric, or the filter fabric may be covered with 4 inches of gravel and the 8 inches to 12 inches rock may be dumped from a height not to exceed 16 inches. Rocks greater than 12 inches shall only be dumped onto filter fabric protected with a layer of gravel with a thickness equal to one half the D₅₀ rock size, and the dump height limited to twice the depth of the gravel protection layer thickness.

For proper operation of the apron, align the apron with the receiving stream and keep it straight throughout its length. If a curve is needed to fit site conditions, place it within the upper section of the apron. Outlets on slopes steeper than 10 percent should have additional protection.
ii. Sediment Basins

A sediment basin is a basin formed by excavation or by constructing an embankment such that sediment-laden runoff is temporarily detained, allowing sediment to settle out of the runoff before it is discharged.

Sediment basins can be installed for temporary (e.g., during construction) and permanent purposes and must be designed by a civil engineer. They are generally limited to drainage areas greater than 5, but less than 75 acres.

Design sediment basins to drain within 72 hours following storms. The length of the basin should be more than twice the width of the basin, determined by measuring the distance between the inlet and the outlet.

To prevent the potential for erosion of the sediment basin, protect all exposed slopes using rock, vegetation, or an erosion control product detailed in Chapter 5 of this manual. Install a velocity dissipation device at the outlet of the sediment basin to prevent erosion and scouring of the outlet channel.
CHAPTER 3: PROJECT DESIGN – AGRICULTURAL ROADS AND AVENUES

Agricultural roads and avenues are the two principal components of the agricultural road network in vineyards and orchards. Agricultural roads and avenues are especially susceptible to impacting natural stream channels as roads and their drainage systems are often hydrologically connected to watercourses through runoff from surfaces and ditches, and as they are generally located at the edges of vineyard blocks, they thereby must manage surface runoff from upslope vineyards.

Agricultural roads and avenues and their associated ditches, cutbanks, and fill slopes and of the code, must be designed and constructed in accordance with Sections 36.18.030, 36.18.070, and 36.18.130.C. of the code to maintain natural and existing drainage patterns, maximize infiltration, minimize erosion, and limit the discharge of sediment by utilizing the BMPs presented in this chapter. In addition, as they are key elements of vineyard and orchard infrastructure, both agricultural roads and avenues and any associated structures must be set back from existing natural features in accordance with the setbacks prescribed in Chapter 36 of the code.

In addition to utilizing the BMPs described in this chapter, prior to any road construction or modification it is recommended to consult the Handbook for Forest, Ranch & Rural Roads\(^1\) for additional guidance.

I. Existing Roads

When a project proposes to utilize existing an access feature (road, stream crossing, etc.) as part of the agricultural road network, the access feature in its current state must be functional for the intended use, e.g. design vehicle and level of service.

Access features which require improvements to serve the intended use, shall be considered to be part of development and can be modified as part of the project, subject to the following limitations:

- All proposed improvements shall be shown on the project plans;
- Improvements must comply with the standards of this chapter;
- Existing roads that serve the project, but that do not qualify as agricultural roads or avenues are not considered part of the development permitted by the Department of Agriculture; and
- Modifications to existing roads located within a setback area are not permitted by the Department of Agriculture*.  

\*Note: The Department of Agriculture is not the permitting agency for modifications to existing roads located within the jurisdiction of state and federal resource agencies. If it is determined that an existing road located within the jurisdiction of state and federal resource agencies requires modification, consult with the PRMD.

II. Existing Stream Crossings

Show on the project plans all existing road stream crossings which are proposed to serve the development. For stream crossings which require improvements in order to serve the development, indicate

\(^1\) [http://www.pacificwatershed.com/sites/default/files/roadsenglishbookapril2015b_0.pdf](http://www.pacificwatershed.com/sites/default/files/roadsenglishbookapril2015b_0.pdf)
the proposed improvements within the setback area are not a part of the development along with a note stating all necessary permits from local, state, and federal agencies will be acquired prior to making any improvements. Improvements to existing crossings are not under the permitting authority of the Department of Agriculture.

III. General Considerations for New Agricultural Roads and Avenues

The key to successfully managing surface runoff from agricultural roads and reducing the degree of hydrologic connectivity is to direct the flows away from the surface, cut slopes, and fill slopes of the road as quickly as possible, before flows can concentrate and cause erosion. This can be achieved by incorporating the following standards for surface and drainage system design. During construction of agricultural roads and avenues, the BMPs presented in Chapter 1 of this manual shall be employed.

Roads are typically used year-round to convey workers and equipment, and are generally rocked or paved, whereas avenues are seasonal, primarily dirt or grass and must be winterized in accordance with Section 36.18.150 of the code and Chapter 5 of this manual. Agricultural avenues, by contract, are most often used seasonally and typically follow the contours of the blocks they transverse. As such, they generally do not need to be designed in accordance with the following standards and shall be managed in accordance with the principles described in Chapter 2 of this manual. Additionally, if properly winterized in accordance with Chapter 1 of this manual, the vegetated surface of agricultural avenues limits the potential for surface erosion during the rainy season.

IV. Surface Design

As described above, the primary goal of road design is to remove the surface runoff from the road surface as quickly as possible. However, surface runoff must additionally be manipulated in such a manner that stormwater runoff is diffused prior to its released to any setback area or off the site and erosion of the road surface and disposal location is limited in compliance with Sections 36.18.030.C and D. of the code.

The slope of the road surface can be manipulated to control the direction of surface runoff through the following:

- Outsloping
- Insloping
- Crowning
- Limiting Slope Lengths

A. Outsloping

Outsloping allows for runoff to be dispersed and drained as sheet flow along the entire outside edge of the road and generally causes the least disturbance and soil movement. They are often less expensive to construct than other road features, easier to maintain, and do not require the construction of additional drainage features like ditches, berms, or water bars. As they promote even draining of the road surface, erosion of the surface and disruption of the natural sheet flow pattern of the surrounding landscape are minimized.

Outsloped roads utilize rolling dips, detailed below, at changes in slope, to keep flows hydrologically disconnected and limit stormwater flow lengths. The desired shape of an outsloped road should have at least a 4 percent slope from the cut bank to the outside edge of the road. This can be achieved by removing any...
outboard berm, lowering the outboard side of the road and using pulled fill material to raise the inboard side of the road and fill the inboard ditch.

**B. Insloping**

Insloped roads are to be utilized when flows from hillsides and cut slopes need to be kept off the road surface because it is unstable, or it is located next to a stream. Insloped roads drain surface runoff to the inside of a roadbed where it can be conveyed in an inboard ditch to a ditch relief culvert (described below) with an outlet stabilized in accordance with Chapter 2 of this manual.

A properly constructed and well-maintained ditch is a key component of this design. Inboard ditches should be drained at intervals sufficient to prevent ditch erosion which could lead to the transport of sediment into a nearby watercourse.

**C. Crowning**

In some cases, a combination of insloped and outsloped designs are used in crowned roads. This design is suitable for scenarios where the inboard ditch is not sufficient to handle 100 percent of flows from the roadbed and flows across the road surface are anticipated. Crowned roads allow the ditch to convey flows from the hillside and cut bank areas, while the outsloped side of the road can facilitate sheet flow across the road surface.
Limiting Slope Lengths

Limiting slope lengths is key to limiting erosion and post-development stormwater runoff from road surfaces. Utilize rolling dips on permanent and seasonal roads or water bars on seasonal or temporary unsurfaced roads at frequent intervals to disperse road surface runoff from steep road segments. These drainage structures are described in the following section.

V. Drainage Structure Design

Road drainage structures are designed to convey stormwater runoff across or away from road surfaces, while limiting post-development stormwater runoff, erosion, and pollutant discharges. These structures include rolling dips, water bars, ditches, and ditch relief culverts.

A. Rolling Dips

Rolling dips are designed to drain surface runoff away from the road surface and unlike water bars, described blow, they are meant for highly traveled roads. While they may be used for insloped or crowned roads, the goal of effective drainage is to disperse, rather than collect and concentrate road runoff. They are usually installed perpendicular to the road alignment with a cross slope of 3 percent to 5 percent greater than the road grade and should drain onto the outboard side of the road. Rolling dips are limited to slopes of less than 12-14
percent and require that any outside berm be removed for the entire length of the rolling dip. The outlet of the rolling dip shall be protected with rock, logs, branches, or brush to minimize erosion.

Construction of frequently installed rolling dips will ensure the most reliant form of road drainage with the least amount of maintenance. On average, rolling dips should be constructed such that each captures no more than 150 feet of road drainage. The spacing of rolling dips, their effect on hydrologic connectivity, and factors influencing discharge points are best determined by a civil engineer.

B. Water Bars

Water bars are shallow, abrupt, excavated dips or troughs with an adjacent, downslope hump or mounded berm and utilized in a similar manner to rolling dips, to reduce the hydrologic connectivity of a road segment and divert surface runoff to stable outlets. In contrast to rolling dips, however, water bars are recommended on agricultural roads that cannot accommodate rolling dips, or on seasonal roads and avenues that are not utilized during the rainy season, as they can be easily rendered dysfunctional by vehicle traffic. Water bars require a high level of maintenance and are to be inspected after each rain event, or more often as needed.

They are oftentimes temporary structures that are regraded at the beginning of each operating season in which the road is to be utilized more frequently and then reconstructed prior to the beginning of the rainy season.

C. Inboard Ditches and Ditch Relief Culverts

Inboard ditches are generally utilized on insloped or crowned roads to capture surface runoff as well flows from the adjacent hillsides or cut slopes. Road ditches that drain directly to stream crossing culvert inlets are typically the most common and important source of hydrologic connectivity between roads and streams. As such, ditch flow lengths should be minimized, especially in cases of hydrologic connectivity to limit the transport of sediment delivered to stream crossings. Line ditches with vegetation or a rolled erosion control material described in Chapter 5 of this manual, to prevent erosion of newly-graded surfaces by concentrated flows and encourage the deposition of sediment.

Ditch relief culverts should be installed at intervals along the road that are close enough to minimize erosion of the inboard ditch and the native hillslope below the culvert outlet, and at locations where collected water is dispersed onto stable areas away from watercourses.
CHAPTER 4: PROJECT DESIGN – TREE REMOVAL

Tree removal, as defined by Chapter 36 of the code, is the removal of more than one-half acre of tree canopy within a new planting area. Projects must adhere to the following BMPs and standards when proposing the removal of more than one-half acre of tree canopy or if more than one-half acre of tree canopy has been removed since November 2008.

Trees help stabilize and protect the land through the combination of canopy and roots. The conversion of tree-covered hillsides into vineyards and orchards has the potential to cause soil loss through an increase in soil erosion\(^2\) and can increase the potential for slope instability. The following best management practices have been designed to reduce the velocity and quantity of runoff and maintain the natural drainage patterns to the extent feasible, when tree removal is proposed.

I. Prohibitions

Tree removal is prohibited in the following areas:

\(\checkmark\) In mapped areas of potentially non-cohesive soils, where natural slopes are between 25 and 40 percent and a geologic report, prepared in accordance with the guidelines in Appendix 1 of this manual, concludes that the factor of safety after tree removal will be less than 1.5 under saturated conditions;

\(\checkmark\) On natural slopes steeper than 40 percent with non-cohesive soils; or

\(\checkmark\) On identified areas of instability – unless the area is repaired in accordance with Chapter 36 of the code and details of the repairs are shown on the project plans.

II. **General Requirements**

All tree removal projects must adhere to the setbacks from the areas of instability and ridgetops detailed in Chapter 36 of the code. In addition, project engineers must determine existing tree canopy and ground cover, as follows.

A. **Pre-Development Tree Canopy**

For projects that have removed trees or other vegetation since November 2008, pre-development cover (canopy) levels will be determined using the aerial photos available at [www.sonomacounty.org/prmd/activemap](http://www.sonomacounty.org/prmd/activemap), or alternative aerial photos as approved by the agricultural commissioner. Pre-development tree canopy can be determined using one of the two following methods:

- Canopy cover determined and reported prior to operations by a Registered Professional Forester;
- The area determined from an existing aerial photograph.

B. **Pre-Development Ground Cover**

Ground cover can be considered all materials in contact with the soil surface. This mainly consists of rock fragments, portions of live vegetation including basal area and plant leaves that touch the soil, plants and plantlike organisms, such as mosses, algae, ferns, fungi, duff, plant litter, crop residue, applied materials, including manure, mulch, and manufactured erosion control products.

A sampling procedure placed in a uniform grid shall be used to determine the ground cover of the area prior to operations. Plots shall be placed on a 50-foot x 50-foot grid or a minimum of 10 plots per contiguous area. Ground cover shall be measured from the percent bare soil covering the circle relative to the area absent of bare soil within a 1/300th acre circle (6’8"). Ground cover shall be determined from the average amount of cover within each plot, within the project area.

III. **Level II Project Requirements**

A. **Geologic Report**

A geologic report prepared by an engineering geologist in accordance with the Geologic Report guidelines in Appendix 1 of this manual is required for all Level II projects proposing tree removal to identify and characterize all areas of instability. In addition, for sites with natural slopes greater than 25-percent in mapped areas of potentially non-cohesive soils, the engineering geologist shall review the site for non-cohesive soils. A non-cohesive soil, as defined by Chapter 36 of the code, is a soil where the particle size of the smaller than 2mm fraction of the soil is coarser than Loam as defined by the Natural Resources Conservation Service soil texture classification scheme. A list of potentially non-cohesive soils and procedures for determining cohesion properties of soil are included in the Geologic Report guidelines in Appendix 1 of this manual.

B. **Soil Loss/Sediment Delivery Calculations**
The civil engineer must evaluate pre-development and post development conditions for each block proposing tree removal to demonstrate no net increase in erosion from pre-development conditions. Such evaluation must demonstrate the soil loss ratio between pre-and post-development and must be included as part of the engineered plan, depending on the natural slope of the area.

Pre-and post-development soil loss shall be calculated using the Universal Soil Loss Equation (USLE) or the Revised Universal Soil Loss Equation (RUSLE2) according to the natural slope of the area. USLE is to be used for slopes less than or equal to 25 percent, while RUSLE is to be used for slopes greater than 25 percent and less than 50 percent. Per Section 36.20.020.D. of the code, new vineyard and orchard development shall be prohibited on slopes greater than 50 percent.

Alternatively, the applicant may use another published or peer reviewed soil loss predictive model to show no net increase in erosion from pre-development conditions or may prepare a sediment delivery analysis using a published or peer-reviewed method consistent with the standard of care that demonstrates that the project will not result in a net increase in sediment delivery to streams, lakes or wetlands. Projects not using a sediment delivery analysis require a soil loss ratio of 1 or less.

The USLE and RUSLE2 soil loss equations are based on the following formula:

\[ A = R \times K \times LS \times C \times P, \]

where

- \( A \) = average annual soil loss (tons per acre);
- \( R \) = rainfall erosivity factor;
- \( K \) = soil erodibility value;
- \( LS \) = topographic factor (\( L=\)slope length, \( S=\)slope);
- \( C \) = vegetation factor (type/height of canopy and percent canopy/ground cover); and
- \( P \) = erosion control practice factor.

Divide the development area into blocks with similar landforms and slopes, generally no more than 20 acres in size for purposes of calculating the soil loss ratio or performing a sediment delivery analysis. For example, use existing drainages, major slope breaks, and topographic divides as natural boundaries between blocks. Then calculate a soil loss factor for pre- and post-development conditions for each block using the topographic (LS), vegetation (C) factors, and erosion control practices factors as described below or using the RUSLE2 computer model that can be downloaded for free from the NRCS website: [http://www.ars.usda.gov/Research/docs.htm?docid=6038](http://www.ars.usda.gov/Research/docs.htm?docid=6038).

1. **Pre-development Soil Loss Factor** = \( LS_i \times C_i \times P_i \)

This soil loss factor sets the target for the post-development permanent erosion control requirements. The following sections describe how to determine these values based on site characteristics. For the purposes of calculating the soil loss ratio, the factors of \( R \) and \( K \) are removed from the equation given the assumption that rainfall and soil type will be unchanged by site development.
a. For projects with slopes less than or equal to 25 percent, find the LS$_i$ factor on the Length of Slope (LS) Values table included in Appendix 6 of this manual.

b. For projects with slopes greater than 25 percent, determine LS$_i$ using RUSLE2.

iii. Vegetation Factor (C$_i$)

a. For projects with slopes less than or equal to 25 percent, determine the C$_i$ factor using the methods detailed in the General Requirements section of this chapter, above, coupled with the Vegetation Factor (C$_i$) table included in Appendix 6 of this manual.

b. For projects with slopes greater than 25 percent, determine C$_i$ using RUSLE2.

iv. Existing Erosion Control Practice Factor (P$_i$)

a. If the site is being converted from an existing development use, determine the P$_i$ factor using the Erosion Control Practice Factor (P) included in Appendix 6 of this manual.

b. If the site is undeveloped, use a value of 1.

4. Post Development Soil Loss Ratio

The soil loss ratio sets the target for the post-development permanent erosion control requirements. The final soil loss ratio for a site must be less than or equal to 1, which means soil loss cannot be increased by site development. Through the judicious use of erosion control BMPs described in Chapter 5 of this manual, the predicted final post-development soil loss can be designed to be less than or equal to the pre-development predicted soil loss of the site.

Determine the C$_f$ factor, then calculate the Final Erosion Control Gap to determine the gap that a site designer needs to close in order to meet or exceed the pre-development soil loss conditions.

i. Vegetation Factor (C$_f$)

a. For projects with slopes less than or equal to 25 percent, determine the C$_f$ factor using the Vineyard Cover Factor (C$_f$) table included in Appendix 6 of this manual.

b. For projects with slopes greater than 25 percent, determine C$_f$ using RUSLE2.

ii. Determining the Final Erosion Control Gap

a. Divide the pre-development soil loss factor by the C$_f$ value determined above.

b. Through an iterative process, the BMPs will be selected which will result in P$_f$ and LS$_f$ values that close the Final Erosion Control Gap.
IV. Tree Removal Operations

All sites proposing tree removal must adhere to the following standards when carrying out tree removal operations. Tree removal is permitted only between April 1st and October 15th, however at all times, erosion control measures must be employed as required by Article 18 of Chapter 36 of the Code and detailed in Chapter 5 of this manual.

All trees and vegetation to be preserved during construction must be protected and marked at a height visible to equipment operators. To the extent feasible, preserve existing ground cover surrounding vegetation to be preserved. Remove debris from tree removal operations from locations in which it could potentially enter watercourses. Debris from tree removal must not be staged in a setback or riparian area.

V. Monitoring and Reporting

Annual site monitoring shall occur for a minimum of three years following the final inspection. The project owner shall inspect the site for significant erosion or instability prior to October 15th and monthly from October to May. Annual monitoring reports shall be prepared and submitted to the agricultural commissioner on June 30th of each monitoring year.

A. Report Requirements

1. General Requirements

Identical color photographic scenes shall be taken and submitted to the agricultural commissioner before development and each January from specific locations as identified in the project permit County staff shall perform at least one on-site inspection at the end of the three-year monitoring period, and other inspections as necessary.

2. Year One Report Contents

The monitoring report for the first year after development and the final inspection have been completed shall include a pre-development site characterization, as well as results from the year of monitoring.

3. Years Two and Three Report Contents

Thereafter, annual reports shall include a summary of the year’s monitoring results and a discussion of trends noted, or problems observed, as well as a description of any repairs that were made. The report must include a description of the monitoring methods, including data collection and analysis.
B. Compliance

Projects that already have an approved CEQA document that contains measures that reduce geologic hazards and water quality impacts to a level of insignificance shall be considered to be in compliance with the applicable requirements of Chapter 36 of the code and these best management practices.
CHAPTER 5: PROJECT CONSTRUCTION

The BMPs presented in this chapter focus on limiting soil erosion and the discharge of sediment during the construction of new vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration projects. This includes the movement and/or disturbance of soil attributed to land clearing, vegetation removal, soil preparation, agricultural grading, construction or modification of vineyard or orchard infrastructure, layout of vineyard blocks and vine or tree rows, planting of grapevines or orchard trees, the construction of agricultural drainage systems and agricultural roads and avenues, and other similar work.

Table 5, below, lists the BMPs prescribed for each phase of project construction, depending on site conditions. The subsequent descriptions of each BMP provide detail on specific site conditions that warrant their use.

I. Non-Structural BMPs

Non-Structural BMPs generally consist of processes, prohibitions, procedures, schedule of activities, etc., that prevent pollutants from entering stormwater. They are generally low cost and low technology in nature. Non-structural BMPs described in the following section include:

▲ Scheduling ▲ Winterization ▲ Preservation of Existing Vegetation ▲ Waste Management ▲ Stockpile Management ▲ Stabilized Construction Entrance ▲ Equipment Staging
A. Scheduling

Proper sequencing of new vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration activities shall be incorporated into the schedule of every project, especially during the rainy season to reduce the potential for stormwater to contact disturbed soil, therefore limiting the potential for erosion.

Prior to winterizing the site in accordance with the following section, this includes daily monitoring of the weather forecast for a chance of rainfall and being prepared to deploy the prescribed should a qualifying rain event be predicted. As defined in Chapter 36 of the code, a qualifying rain event is any weather pattern that is forecasted by the National Weather Service to have a 50 percent or greater chance of producing 0.5 inches or more precipitation on a site within a 48 hour or greater period between rain events.

In addition, activities shall be planned and scheduled in accordance with the rainy season requirements detailed in Section 36.18.140 of the code.

B. Winterization

In accordance with Section 36.18.150 of the code, all sites must be adequately winterized by the installation date shown in Table 36-9 of the code, as follows, until such time as the new vineyard and orchard development, vineyard and orchard redevelopment, or agricultural grading or drainage alteration permit is finaled.

- Cover crops established on all disturbed surfaces to 85% coverage; or
- Cover crops planted and straw mulch applied at a rate of 2 tons per acre on all disturbed surfaces.

Once a site has been winterized, work during the rainy season is limited in accordance with Section 36.18.140 of the code.

C. Preservation of Existing Vegetation

Preservation of existing vegetation involves the identification and protection of existing vegetation to be preserved. Per section 36.18.060 of the code, the limits of work-related ground disturbance shall be clearly identified and delineated on the approved plans and specifications, as well as defined and clearly marked at the site prior to beginning any construction activities. Vegetation located in any area outside the defined limits of disturbance must be preserved and undisturbed. Within the limits of work-related ground disturbance, any trees and vegetation to be preserved must be identified and protected from damage by marking, fencing, or other measures.

D. Waste Management

Per section 36.18.130 of the code, soil and other pollutant discharges shall be prevented or controlled. This includes implementing BMPs to limit or reduce the potential for pollutants due to solid and sanitary wastes to come into contact with stormwater.
1. **Solid Wastes**

Among other sources, solid wastes may be generated by trees and shrubs removed during land clearing, packaging materials, domestic wastes from meals, and plant containers during planting. Designate waste collection areas onsite and cover waste bins when not in use and prior to any storm event.

2. **Sanitary Wastes**

In the event that temporary or portable sanitary and septic waste systems are utilized during the implementation of new vineyard and orchard development, vineyard and orchard redevelopment, or agricultural grading and drainage alteration, the following practices shall be followed.

- Locate facilities on level ground away from drainage facilities and streams;
- Equip facilities with containment to prevent the discharge of pollutants; and
- Arrange for regular service and disposal, to be completed in accordance with state and local requirements.

E. **Stockpile Management**

Stockpile management shall be incorporated into all projects that stockpile soil and other loose materials on-site. As loose materials can be transported not only by stormwater, but by wind as well, stockpile management shall be a year-round practice. Stockpile management includes a cover, as well as temporary linear sediment barrier.

During the rainy season and extended periods of inactive construction, stockpiles are to be covered and enclosed with a linear sediment barrier. Uncovered stockpiles during the non-rainy season should be sprayed with water and/or dust-suppressant, as necessary, to control dust emissions.

F. **Stabilized Construction Entrance**

A stabilized construction entrance is needed at all sites to reduce off-site tracking of mud and dirt by vehicles utilized on-site. To implement a stabilized construction entrance, complete the following:

- Define a singular point of entrance/exit on level ground, where possible;
- Place 3 to 6-inch diameter stones to a depth of 12 inches, or as recommended by a civil engineer, and a minimum width of 10 feet;
- Install rumble racks in the entrance, as needed, to help remove additional sediment; and
- Remove built-up aggregate from entrance, as needed prior to and following storm events.

G. **Equipment Staging**

When storing equipment on-site, locate away from drainage facilities and streams and on level ground, if possible. Place secondary containment beneath equipment to prevent the potential discharge of pollutants.
II. Erosion Control BMPs

Erosion Control BMPs are designed primarily to prevent soil and other pollutant discharges; whereas those mainly designed to control soil and other pollutant discharges are Sediment Control BMPs. The incorporation of both Erosion and Sediment Control BMPs throughout the construction of new vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration will limit the discharge of soil and other pollutants post-development.

Erosion control is any practice that protects the soil surface and prevents the movement of soil particles. Effective erosion control practices for vineyard and orchard development and agricultural grading and drainage work include those that limit any impacts during the rainy season and those that maintain cover on the soil. It is not possible to completely prevent all erosion, but erosion can be controlled and reduced to manageable rates through the careful selection and utilization of BMPs.

Erosion control best management practices presented in this chapter include the following:

- Cover Crops
- Straw Mulch
- Erosion Control Products
- Hydraulic Mulch
- Hydroseed

H. Cover Crop

Planting a cover crop is a cost effective and simple method to limit soil and other pollutant discharges. In addition to their ability to help prevent the potential for erosion, cover crops can: improve soil health, diversity, and soil organisms; control weeds; enhance nutrient and moisture availability; increase soil carbon; and control pests.

1. Coverage

An established cover crop is an evenly distributed vegetative cover without bare soil areas which provides self-sustaining, native vegetation that is expected to provide substantial cover prior to the rainy season.

During development, a cover crop must be established to 85% coverage on all disturbed surfaces by the date specified in Section 36.18.150 of the code. In order to ensure 85% coverage has been established by the specified date, cover crop seed must be broadcast by mid-September and irrigation applied as necessary. If the cover crop cannot achieve 85% coverage by the winterization date, straw mulch must be applied over

---

the seeds at a rate of 2 tons per acre. As strip spraying of the cover crop often occurs during the rainy season, leave adequate cover crop to function as erosion control.

2. Types of Cover Crops

Types of cover crops including perennial, annual, fast growing, slow growing, overstory, understory, grasses, and forbs, all of which have the potential to provide a variety of benefits. The ideal mix for a site depends on current and future preferred conditions. When selecting a cover crop mix, select a mix that has both tall, fast growing plants (such as rye, grass, or barley) for overstory protection and leafy, low growing plants (such as clover) for understory protection. The combination of both tall and low plant varieties better protects the soil from rain and erosion. Examples of cover crop seed mixes are shown below. For additional information, watch Discover the Cover at www.youtube.com/watch?v=VHMCJSxQAgO.

Examples of cover crop seed mixes are detailed below:

I. Straw Mulch

Mulch is a low-cost and effective erosion control measure that is used to protect exposed soil from the elements when stabilization has not been achieved by other means. While various mulch products are available, straw mulch is the most common mulch and is often used in conjunction with freshly-spread cover crop seed to help protect the seeds until they can become established.
1. Installation and Maintenance

Straw mulch can be applied by hand or using commercial blowers, depending on the type of application needed. To be effective, straw must be applied at the rate of 2 tons per acre (approximately 42 bales per acre) and should cover the entire seeded or exposed area, leaving no exposed soil.

To prevent newly spread straw from blowing away in areas with strong winds, the straw must be anchored to the ground by matting, crimping, or other methods. Compounds such as organic tackifiers can also help to reduce this by increasing the stickiness of loose straw.
C. Geotextiles and Mats

Erosion control products, including geotextiles, mats, and erosion control blankets, are used to cover and stabilize exposed surfaces from erosion, hold soil in place, and absorb and hold moisture near the soil surface. They vary in material, price, and suitability, but are generally biodegradable products that are anchored to the soil with metal staples or wooden stakes. In the context of this manual, use only biodegradable products.

Erosion control products are most effective in the following locations:

▲ Steep slopes and disturbed areas where mulch anchoring would be needed;
▲ Disturbed areas where vegetation establishes slowly; and
▲ Constructed swales or drainage ditches where vegetation is difficult to establish.

They are not suitable for rocky sites or in areas such as vineyard avenues where final vegetation will be mowed.

1. Installation and Maintenance

Erosion control products are most effective when the site is properly prepared prior to their installation. Remove all rocks, vegetation, and other obstructions to allow the installed product direct contact with the soil. In addition, seed the area before installation to encourage revegetation and long-term stability.

III. Sediment Control BMPs

Sedimentation is the process of soil and rock detachment (erosion), transport, and deposition. Sediment Control practices slow the velocity of water, control the direction and distance it travels through the site, and filter, trap, or settle soil particles\(^4\). The following BMPs are designed to prevent soil particles from leaving the site by directing runoff to trap loose soil particles and promoting the infiltration of sheet flow:

▲ Fiber Rolls/Straw Wattles
▲ Straw Bale Barrier
▲ Filter Strip
▲ Check Dams

---

D. Fiber Rolls/Straw Wattles

Fiber rolls or straw wattles are wood excelsior or coconut fibers rolled or bound into a tight tubular roll and are to be used to stabilize the site during winterization and post-development to reduce stormwater flow velocities, intercept runoff, and filter and trap sediment. While various types of fiber rolls exist, those made of biodegradable filler and netting materials are to be used for agricultural development.

Fiber rolls should not be placed in areas of concentrated flow, such as across constructed swales or drainage ditches with more than 2 acres of contributing drainage area.

1. Installation and Maintenance

Fiber rolls are designed to be installed along the contour on all slopes 10% or greater, in areas of slow surface flows. A general rule of thumb for vertical spacing is:

- 10% - 20% slopes = 60 feet apart,
- 20% - 50% slopes = 30 feet apart,
- Greater than 50% slopes = 10 feet apart, or
- As the project engineer dictates.

Fiber rolls are installed in a shallow trench forming a continuous barrier along the contour in a shallow depression (about 3 to 5 inches deep). Stake fiber rolls into place using a 1x2x24 or 2x2x24 wooden stake. Once in place, secure the fiber roll with foot-tamped backfill on the uphill side to prevent water from undercutting it. Overlap ends horizontally by 6 inches and toe stakes at 45 degree angles to anchor the ends.
B. Straw Bale Barrier

Straw bale barriers are used as sediment traps and check dams that function, in part, by detaining sediment-laden runoff long enough for sediment to deposit behind the bales. They are primarily used to control and filter stormwater flows in areas with low velocities and should never be used in streams or high flow areas.
1. Installation and Maintenance

Install straw bale barriers along the contour, by placing bales in a row with ends tightly abutting adjacent bales. Embed each bale in the soil at least 4 inches and once set, drive stakes or rebar through the bales and into the ground 1.5 to 2 feet for anchorage. See images below for a detailed depiction of proper installation. When placed in a constructed swale or drainage ditch, install straw bales in a channel-like configuration that will direct the flows to a single low point.
C. Filter Strip

A filter strip is a gently sloping vegetated strip of land or area established to remove sediment and other pollutants from runoff and encourage stormwater infiltration. It is an effective method to trap sediment before it is delivered into environmentally sensitive areas such as streams and other water bodies.

1. Installation and Maintenance

Install filter strips on the approximate contour downslope of disturbed areas and where sheet flow has been reduced to non-erosive levels. Filter strips are most effective on slopes of 5% or less, are maintained at 85% vegetative cover and are 25’ to 50’ wide.

Many of the plant species used for cover crops, such as low growing, perennial grasses, can be utilized for filter strips as well. As with cover crops, described above, plant seeds uniformly over the area designated for the filter strip and fully cover newly seeded areas with mulch to facilitate vegetation establishment.

After establishment, maintain 85% vegetative cover by mowing and reseeding when necessary. Restore or replant the filter strip if it accumulates so much sediment that it no longer functions effectively.

Yearly replanting and maintenance will be required to ensure the health and function of the filter strip, especially if development plans utilize the strip as a vegetated avenue.

D. Check Dams

Check dams are small barriers composed of rock, gravel bags, sandbags, or fiber rolls placed across a swale or drainage ditch to reduce the effective slope of the channel and flow velocity. They also help to remove sediment from runoff by detaining sediment-laden runoff long enough for sediment to deposit behind the check dams. They should be limited to channels that drain 10 acres or less.

1. Installation and Maintenance

Evenly space check dams in the channel in which they are placed. They are not to be used in channels that are grass-lined, unless sediment-laden flows or flows with erosive velocities are anticipated.
I. PURPOSE

To specify general guidelines for professional geologists to prepare geologic reports for the following:

1. New vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration in any setback from areas of slope instability prescribed in Section 36.18.080 of the code and listed in Table 1, below;
2. New vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration proposed across repaired areas of slope instability;
3. Level II projects proposing tree removal, to identify and characterize potential areas of instability;
4. Level II projects proposing tree removal in areas of mapped potentially non-cohesive soils, with natural slopes steeper than 25 percent; and
5. To generally inform designers about geologic hazards which may be affected by proposed new vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage.

A geologic report is valid for three years from the date of the report. Reports older than three years will require an update from the professional geologist and address any changed conditions on the site.

A geologic report prepared under these guidelines is a written document prepared by a professional geologist which presents the application of scientific knowledge, principles, and methods to geological problems by investigating, measuring, interpreting and reporting on the physical phenomena of the earth. These guidelines present standards for preparing a geologic report to be utilized in the planning, design, construction, and maintenance of new vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration. The following sections describe the procedures for properly evaluating the geology of the site in relation to the planned development and the content that must be included in a geologic report.

II. GEOLOGIC REPORT METHODS

A geologic report shall characterize the areas of instability, surficial soils, and subsurface geology and evaluate local geology and geomorphology relative to the planned development in accordance with the following methods.

A. Assessment Area

The assessment area shall be large enough to fully characterize the site and include:

1. All areas of slope instability within or near the area of planned development;
2. Limits of the new vineyard or orchard planting or vineyard or orchard replanting areas;
3. Vineyard avenues, access roads and equipment turn-around areas;
4. Areas of proposed grading and drainage improvements; and
5. Any other area that may be part of or may be affected by the planned development.

B. Background Data Review

At a minimum, the following sources shall be consulted during the background data review and presented and properly cited in the report.

1. Relevant public domain geologic reports;
2. Most recent topography using USGS 7.5-minute topographic or a site-specific topographic survey, if available;
3. Sonoma County LIDAR data set;
4. Current geologic maps; and
5. Current and historic aerial imagery.

C. Field Work Methodology

Field work shall be conducted to identify and/or confirm identified areas of instability and potential non-cohesive soils, characterize the surficial soils, subsurface geology, and geomorphic features. The proper field work methodology to sufficiently characterize the site may be determined at the discretion of the professional geologist completing the report.

D. Field Work for Non-Cohesive Soils (Tree Removal Projects Only)

For sites with natural slopes greater than 25 percent in mapped areas of potentially non-cohesive soils, the professional geologist shall review the site for non-cohesive soils. A non-cohesive soil, as defined by Chapter 36 of the code, is a soil where the particle size of the smaller than 2mm fraction of the soil is coarser than Loam as defined by the Natural Resources Conservation Service (NRCS) soil texture classification scheme. A list of potentially non-cohesive soils in Sonoma County is included following the References section of these guidelines.

The preferred approach to characterize a site with potentially non-cohesive soils is to divide the site into blocks generally no more than 20 acres in size, based on existing natural features, such as drainage courses, major slope breaks, and topographic divides and make observations based on each of the blocks.

E. Lab Testing for Non-Cohesive Soils

For sites with natural slopes between 25 and 40 percent slope in areas of non-cohesive soils identified by the geologic report, a slope stability analysis shall be conducted. Tree removal shall be prohibited when the factor of safety (static) is less than 1.5 under saturated conditions after tree removal. Development is prohibited in areas of non-cohesive soils with slopes greater than 40 percent.
III. GEOLOGIC REPORT CONTENTS

A geologic report shall contain the following sections, at a minimum. Additional sections may be included, as deemed necessary by the professional geologist completing the report.

A. Cover Page

Each report shall provide a cover page which includes the following:

1. Project Name;
2. Applicant name and contact information;
3. Property Owner, if different from applicant;
4. Physical address of the property, if applicable;
5. Assessor’s Parcel Number (APN);
6. Name and qualifications of professional completing report; and
7. Date of report.

B. General Information

Each report shall provide a general site description which shall include the following:

1. Description of site conditions, including location, elevation, site dimensions, slopes;
2. Proposed development, including grading and drainage;
3. Description of the general assessment area and its setting with respect to major geographic and geologic features;
4. Topography and drainage in the area; and
5. Abundance, distribution, and general nature of exposures of earth materials within the area.

C. Field Work Description

The report shall include the following details regarding the completed field work, as applicable:

1. Date field work completed;
2. Name of the individual responsible for geologic mapping;
3. Detailed description of the field methodology used;
4. Description of how the slope stability was characterized and mapped for each feature;
5. Description of laboratory testing completed to characterize soils; and
6. A complete record of all field observations and laboratory tests.

D. Geologic Descriptions

Each geologic report shall contain a complete and accurate description of all geologic conditions listed below recognized or inferred within the assessment area. Where interpretations are added to the recording of direct observations, the bases for such interpretations must be clearly stated.

1. Soil type, as defined in the NRCS Soil Survey of Sonoma County;
2. Bedrock geology, including:
   i. Formation names and ages;
   ii. Lithology (rock types);
iii. Distribution and dimensions of any exposures (for example: thickness, outcrop, breadth, vertical extent); and
iv. Any features in response to natural surface and near-surface processes;

3. Geomorphology, including:
   i. Landslides;
   ii. Landscape geomorphology indicative of potentially unstable slopes;
      a. Inner gorges;
      b. Debris slide slopes;
      c. Hummocky areas;
      d. Closed depressions;
      e. Disorganized drainages;
      f. Disrupted linear features such as fences or roads;
      g. Benches of questionable origin;
      h. Tension cracks;
      i. Leaning trees; or
      j. Seepage sites;

4. Subsurface geology;

5. Drainage (surface water and groundwater), including its relation to topography and geologic features; and

6. Geologic features of special significance not already included in the previous descriptions, including:
   i. Features representing accelerated erosion (cliff reentrants, badlands, advancing gully heads);
   ii. Features indicating subsidence of settlement (fissures, scarplets, offset reference features, historic records and measurement);
   iii. Features indicating creep (fissures, scarplets, distinctive patterns of cracks and/or vegetation, topographic bulges, displaced or tilted reference features, historic records and measurements); and
   iv. Slump and slide masses in bedrock and/or surficial deposits.

E. Consideration of Geology in Recommendations

Geologic evaluations performed in accordance with the guidelines presented herein must consider topography, soil classification, geomorphology, geologic structure, slope gradient/orientation, planned vine row orientation, planned drainage systems, sheet flow drainage, and proposed setbacks from areas of slope instability if different from those required by Chapter 36 of the code, and listed in Table 1, below.

<table>
<thead>
<tr>
<th>Location</th>
<th>Setback for New Vineyard and Orchard Development Areas and Vineyard and Orchard Redevelopment Areas</th>
</tr>
</thead>
<tbody>
<tr>
<td>Below and lateral to area of slope instability</td>
<td>50 feet from the mapped boundary, unless a geologic report recommends a lesser or greater setback</td>
</tr>
<tr>
<td>Above area of slope instability</td>
<td>100 feet from the mapped boundary, unless a geologic report recommends a lesser or greater setback</td>
</tr>
</tbody>
</table>
F. Recommendations

Recommendations shall be based on a well-reasoned analysis of the planned development in relation to all geologic observations. Slope instability setbacks shall be based on their potential for adverse impacts to slope stability, mass wasting, and erosion.

G. Maps

All mapping shall be completed using a detailed topographic map, with the basis of the map indicated. Mapping shall consider the lithology, structural elements, and three-dimensional distribution of the earth materials exposed or inferred within the assessment area. All maps must use the most recent imagery available and include project name, north arrow, bar scale and text scale, date and source of imagery, and current date.

The following maps should be included as part of a complete assessment:

1. Location map showing the physical address of the property;
2. Site Development map, including planned development, with areas of instability and any other pertinent geologic features identified; and
3. Topographic, hillshade, or aerial photo map(s) showing setback areas where development is precluded, all areas of identified slope instability, test pit locations, and a clearly defined assessment area.

H. References

Provide a reference for all documents and resources used and list of persons consulted, including dates of access for online records and of conversation for personal consultation.

I. PURPOSE

To specify general guidelines for qualified civil engineers to prepare geotechnical/soils reports in support of the following:

1. Engineered agricultural grading, as defined by Chapter 36 of the code;
2. A slope greater than 2 feet horizontal to 1 foot vertical (50 percent) for cut and fill surfaces, in accordance with Sections 36.18.020.B.1. and 36.18.020.C.7 of the code, respectively;
3. To justify terracing and drainage of cuts and fills with surface slopes greater than 3 feet horizontal to 1 foot vertical (33 percent), as described in Section 36.18.020.D. of the code; or
4. New vineyard and orchard development proposed on fill slopes supporting structures and surcharges, as required by Section 36.20.020.A. of the code.

A geotechnical/soils report prepared under these guidelines is a written document prepared by a qualified civil engineer which presents the application of scientific knowledge, principles and methods to inform agricultural grading designed in accordance with Section 36.18.020 of the code and should be prepared with sufficient clarity to indicate the nature and extent of proposed the grading improvements. Where geologic hazards have been identified within the area of proposed grading, the report must be prepared in consultation with a professional geologist. Where conflicts occur between the technical requirements of Chapter 36 of the code and the geotechnical/soils report, the recommendations presented in the geotechnical/soils report govern.

A geotechnical/soils report is valid for three years from the date of the report. Reports older than three years will require an update from the qualified civil engineer and address any changed conditions on the site.

II. GEOTECHNICAL REPORT METHODS

A. Assessment Area

The assessment area must be large enough to fully characterize all areas of proposed grading and include:

1. All areas of proposed grading;
2. Limits of the new vineyard or orchard development and vineyard and orchard redevelopment;
3. Agricultural avenues, agricultural roads and equipment turn-around areas;
4. Areas with drainage facilities and systems; and
5. Any other area that may be affected by the planned grading.
B. Background Data Review

At a minimum, the following sources should be consulted during the background data review and presented in the report.

1. Relevant geotechnical investigations obtained from published work or previous consultant reports;
2. Most recent topography using USGS 7.5 minute topographic or a site-specific topographic survey, if available;
3. Sonoma County LIDAR data set; and

III. Field Exploration Methodology

Field explorations shall be conducted to characterize the nature, distribution and strength of existing soils and if present, identify and/or confirm areas of instability. Geotechnical explorations may include borings, test pits, and trenches, however the proper field exploration methodology may be chosen at the discretion of the civil engineer completing the report.

A. Laboratory Testing

Laboratory testing shall be performed to substantiate all findings, conclusions, and recommendations. Laboratory testing procedures shall be described in detail, with relevant references to ASTM testing standards. Geotechnical/soils reports shall present results in well-organized tables and graphical laboratory test sheets.

IV. GEOTECHNICAL REPORT CONTENTS

Geotechnical/soils reports must include information regarding the nature, distribution and strength of existing soils, conclusions, and recommendations for grading procedures and design criteria. Geologic conditions on the site must be fully characterized based on field data and laboratory testing.

A geotechnical/soils report shall contain the following sections, at a minimum. Additional sections may be included, as deemed necessary by the civil engineer completing the report. In addition to the sections outlined below, when geologic hazards have been identified within the area of proposed grading, the report must contain a section prepared by a professional geologist that includes an adequate description of the geology of the site and conclusions and recommendations regarding the effect of geologic conditions on the proposed work.

A. Cover Page

Each report shall provide a cover page which includes the following:

1. Project Name;
2. Applicant name and contact information;
3. Property Owner, if different from applicant;
4. Physical address of the property, if applicable;
5. Assessor’s Parcel Number (APN);
6. Name and qualifications of professional preparing report; and
7. Date of Report.

B. General Site Information

Each report shall provide a general site description based, in part, on the field data and laboratory testing, and shall include detailed descriptions of the following:

1. Existing site conditions including location, elevation, site dimensions, slopes, topography, and drainage;
2. Proposed development, including drainage improvements;
3. Geologic setting relative to major geographic and geologic features;
4. Engineering properties and distribution of geologic units identified on the site, if any;
5. Subsurface geologic structure; and
6. Groundwater, including current and historic high groundwater levels, and geologic structures that may influence groundwater movements.

C. Documentation of Field Exploration

Each geotechnical/soils report shall contain a complete description of the field exploration, including:

1. Type and number of field explorations.
2. Date field work completed and name of individual responsible for field work.
3. Detailed description of the field methodology used, with clear discussions and complete, graphic logs of excavations. Methods of excavation, and the methods and type(s) of sampling should be clearly defined and discussed.
4. Extent and content of any laboratory testing.
5. Calculations and analyses performed.
6. A complete record of all field observations and laboratory tests shall be included within the final report.

D. Engineering Analysis

Engineering analyses should be based on substantiated geotechnical data and should provide the basis for the conclusions and recommendations of the geotechnical/soils report. Engineering analyses performed using computer programs shall include reference information regarding the software used and include printouts of applicable input and output files.

E. Conclusions and Recommendations

Conclusions and recommendations shall be directly related to one of following the proposed agricultural grading activities requiring the geotechnical/soils report:

1. Engineered agricultural grading, as defined by Chapter 36 of the code;
2. Cuts and fills with a surface slope greater than 2 feet horizontal to 1 foot vertical (50 percent), in accordance with Sections 36.18.020.B.1. and 36.18.020.C.7 of the code, respectively;
3. Terracing and drainage of cuts and fills with surface slopes greater than 3 feet horizontal to 1 foot vertical (33 percent), as described in Section 36.18.020.D. of the code; or
4. New vineyard and orchard development proposed on fill slopes supporting structures and surcharges, as required by Section 36.20.020.A. of the code.

Recommendations for proposed agricultural grading must be based on a thorough analysis of the planned development based on the technical findings. Findings, conclusions and recommendations shall be substantiated using site-specific field and/or laboratory data and appropriate analyses. Where professional judgment is utilized to augment the data and analyses, a technical rationale shall be clearly discussed.

F. Maps

All mapping shall be completed using a detailed topographic map, with the basis of the map indicated. All maps must use the most recent imagery available and include project name, north arrow, bar scale and text scale, date and source of imagery, and current date.

The following maps shall be included as part of a complete assessment:

1. Location map showing the physical address of the property.
2. Site Development map, including planned planting and/or replanting areas, access roads, vehicle turnaround, and all other development features, with areas of proposed grading identified.
3. Site Geotechnical map, including locations of the proposed grading, all exploratory borings and trenches/test pits, geologic cross-sections, and plotted geologic data from all subsurface excavations.

G. References

Provide a reference for all documents and resources used and list of persons consulted.

H. Plan Review and Inspection Responsibilities

The civil engineer responsible for the geotechnical/soils report must provide a letter indicating the plans were prepared in accordance with the recommendations contained in his/her report and must also provide a letter verifying that his/her firm has been employed by the applicant and agrees to provide inspection, furnish as-built grading plans and submit final approval of the agricultural grading in accordance with Chapter 36 of the code.

The civil engineer shall inspect the agricultural grading work at the various stages of the work requiring approvals and more frequently if he/she deems necessary, including preparation of the ground to receive fills and compaction testing, and shall verify the stability of all finish slopes and the design of buttress fills, where required.
I. PURPOSE

To specify general guidelines for professional civil engineers to prepare drainage reports for new vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration projects involving existing and/or proposed drainage systems including:

1. Constructed drainage systems; and/or
2. Overland sheet flow.

A drainage report prepared under these guidelines is a written document prepared by a professional civil engineer which presents the application of scientific knowledge, principles and methods to evaluate existing and/or design proposed drainage facilities and systems and should be prepared with sufficient clarity to provide a comprehensive evaluation of existing drainage facilities and systems and/or indicate the nature and extent of proposed drainage alteration(s), which by definition is the construction or modification of any drainage system. Drainage facilities and systems are to be designed in accordance with Section 36.18.030 of the code and Chapter 2 of this manual in order to maintain natural and existing drainage patterns, maximize infiltration, and limit runoff and erosion. These guidelines present standards for preparing drainage reports to be utilized in the planning, design, construction, and maintenance of vineyard and orchard development and agricultural grading and drainage projects.

II. DRAINAGE REPORT CONTENTS

A. Cover Page

A drainage report shall contain a cover page that contains the following information:

1. Name of project and site address;
2. Assessor’s Parcel Number(s);
3. Property owner name and contact information;
4. Report preparer name and contact information;
5. Seal and signature of civil engineer; and
6. Date prepared.

B. Project Narrative

A drainage report shall provide a general site description which shall include the following:

1. Description of site conditions including: location, elevation, site dimensions, and slopes;
2. Methodologies used to prepare drainage report and analysis;
3. Assumptions pertinent to drainage design;
4. Disclosure of existing on-site and off-site drainage conditions;
5. Proposed development, including grading;
6. Impacts of proposed drainage design; and
7. Topography and drainage in the area.

C. Hydrology and Hydraulic Calculations – Constructed Drainage Facilities

Drainage reports prepared for both existing and/or proposed drainage facilities and systems must present an analysis of pre- and post-development hydrology for all pertinent drainage areas, beginning from the top of the watershed.

Drainage reports prepared for proposed constructed drainage facilities must present the location, width, direction, and quantity of flow for each drainage facility and an analysis of the following:

1. Hydraulic calculations for both proposed and existing (where affected by the drainage design) drainage facilities and systems such as swales, culverts, inlets, v-ditches, storm drains, and outlets such as sediment basins and velocity dissipation devices;
2. Hydraulic calculations for swales, inlets, v-ditches, storm drains, and outlets must clearly demonstrate that the proposed drainage facility has been adequately sized to convey stormwater flows from the proposed project for no less than the 25-year design discharge, whereas stream crossings must be designed for the 100-year design discharge; and
3. Hydraulic Grade Line (HGL) calculations for storm drain pipe network systems where needed, with an explanation of the established or determined starting HGL.

D. Hydrology and Hydraulic Calculations – Sheet Flow

Drainage reports prepared for projects involving sheet flow must analyze the following:

1. Length and time of concentration of sheet flow to determine the point at which sheet flow becomes concentrated;
2. Beginning at the point at which sheet flow becomes shallow concentrated flow, provide engineering justification that the predicted concentrated flows are non-erosive; and
3. If it is determined the predicted shallow concentrated flows are erosive, propose drainage facilities to control flows in accordance with the BMP’s presented in Chapter 2 of this manual.

The length of time of concentration of sheet flow may be analyzed in accordance with the following method or by an alternative published and peer reviewed method. The following method is not intended to produce a rigid or required solution to determining sheet flow characteristics, but rather is intended to assist designers in determining when a limit of sheet flow, and thereby the beginning of shallow concentrated flow, may occur. While these equations provide a method for assessing length and time of concentration of sheet flow, project design must additionally consider onsite soil characteristics, including soil erodibility. The analysis must consider flow paths for sheetflow that analyze worst cases conditions.

Using a hydrology map prepared under these guidelines, measure proposed sheet flow lengths and slope gradient within each hydrologic unit from the top of the watershed to the down slope location where concentrated flow is predicted. Analyze hydrologic conditions using the following method based on findings from the "Assessment of Kinematic Wave Time of Concentration" by McCuen and Spiess (1995). Through analytical means and correlation to field data, McCuen and Spiess developed the following limit relationship
for use by designers to improve the determination of sheet flow length, and thereby the resulting time of concentration of the sheet flow regime.

\[ \frac{nl}{s^{\frac{1}{3}}} \leq 100, \text{ where} \]
\[ n = \text{Manning's } n \]
\[ L = \text{sheet flow length (foot)} \]
\[ s = \text{slope (foot/foot)} \]

Table 1: Manning’s \( n \) values for sheet flow

<table>
<thead>
<tr>
<th>Surface Description</th>
<th>( n )</th>
</tr>
</thead>
<tbody>
<tr>
<td>Smooth Surface</td>
<td>0.011</td>
</tr>
<tr>

</tr>
<tr>
<td>Range (natural) Dense Underbrush</td>
<td>0.80</td>
</tr>
</tbody>
</table>

*Table adapted from USDA Technical Release 55 (USDA, 1986)

Where this ratio conforms to the above limit, the following kinematic wave equation for time of concentration (\( T_c \)) may be used:

\[ T_c = \left( \frac{i}{0.4} \right)^{0.6} \left( \frac{nL}{s^{\frac{1}{3}}} \right)^{0.33}, \text{ where} \]
\[ i = \text{rainfall intensity (inch/hour)} \]

This equation requires an iterative solution. An estimated time of concentration (denoted as \( t_c \)) would be selected for the watershed in question. The IDF curve for the watershed would be entered with the estimated \( t_c \), and desired return period, and resulting rainfall intensity (\( i \)) taken from the IDF curve and entered into the above equation. When the calculated \( T_c \) is equal to the estimated \( t_c \) (\( T_c = t_c \)), the iteration has converged to a solution. The IDF curve prepared by the Sonoma County Water Agency (SCWA) is included below.

Beginning from the point at which it is determined that shallow concentrated flow begins, the equations presented above are no longer applicable and the designer must perform hydrologic analysis consistent with the Drainage Report requirements for Constructed Drainage Facilities, Chapter 36 of the code, and local engineering practice. If it is found that the shallow concentrated flows may be erosive, the flows must be diverted using a conveyance facility discussed in Chapter 2 of this manual.

### E. Hydrology Maps

A hydrology map prepared by a civil engineer shall accompany the drainage report and shall be:

1. A full size sheet no greater than 24" x 36"; and
2. Drawn to an engineering scale no less than 1" = 100'.

A hydrology map shall show the location of all areas subject to stormwater runoff to and from the site and adjacent areas and shall contain the following information:
1. All items listed under the cover sheet requirements, above;
2. North arrow and scale (written and graphic);
3. Property lines, right-or-ways, and easements;
4. Existing and proposed contours and elevations;
5. Location and specifications (size, material, length, slope, etc.) of existing and proposed drainage facilities and systems;
6. Pre- and post-development drainage areas and points of concentration utilized in hydrology analysis;
7. Sheet flow lengths and directions;
8. Elevations for inverts, flowlines, top of grates, high points;
9. Tributary areas beginning from the top of the watershed; and
10. Horizontal and vertical locations of all improvements (include reference to control points).

F. Other Required Documentation

1. Projects within the Flood Prone Urban Area shall include documentation demonstrating the proposed project will not adversely affect existing drainage
2. Projects within Special Flood Hazard Areas shall include documentation demonstrating the proposed project will not cause a reduction in flood carrying capacities (no net fill)
3. Any other supporting or supplemental data, documentation or calculations relevant to the proposed project

G. References

Provide a reference for all documents and resources used and a list of persons consulted.
I. PURPOSE.

To specify general guidelines for qualified professional biologists to prepare wetlands reports for new vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration, as required by Chapter 36 of the Sonoma County Code\(^5\) (Sonoma County New Vineyard and Orchard Development, Vineyard and Orchard Redevelopment, and Agricultural Grading and Drainage Alteration Regulations).

II. REQUIREMENTS.

A wetlands report is required for any new vineyard or orchard development, vineyard or orchard redevelopment, or agricultural grading or drainage alteration where potential wetlands are present on a site, except where exempted from Chapter 36 permit requirements.

New vineyard and orchard development areas, vineyard and orchard redevelopment areas, and agricultural grading and drainage alteration areas are required to be setback from wetlands as set forth in Table 1 below, unless all necessary state and federal permits, approvals, or authorizations to fill the wetlands have been obtained, or the filling of the wetlands is exempt from such requirements.

Table 1. Wetland Setback Requirements

<table>
<thead>
<tr>
<th>Type of Wetlands</th>

<td>50 feet from the mapped boundary, unless a wetlands report recommends a lesser or greater setback</td>
</tr>
</tbody>
</table>

\(^5\) All undesignated chapter and section references are to the Sonoma County Code.
III. PROCEDURE.

Wetlands reports must be prepared by qualified professional biologists using the wetlands identification and mapping methods and reporting standards included in these guidelines. Wetlands reports shall identify any requirements or changes that must be incorporated into the design, layout, and/or construction of proposed new vineyard or orchard development, vineyard or orchard redevelopment, or agricultural grading or drainage alteration. Wetlands reports are not environmental clearance documents for purposes of complying with the California Environmental Quality Act.

Wetlands reports must be submitted to the Department with the permit application. If a biotic resource assessment is prepared, the wetlands report must be included as an appendix to the assessment. (See the Department’s Guidelines for Preparing Biotic Resource Assessments and Focused Species Assessments.)

Wetlands reports are valid for three years from the date of the report. Wetlands reports older than three years must include an addendum from a professional biologist addressing any changed conditions in the study area. The Department may forward permit applications involving wetlands to appropriate state and federal resource agencies for review and consultation.

IV. PROFESSIONAL BIOLOGISTS QUALIFIED TO PREPARE.

Professional biologists preparing wetlands reports must complete a ‘Declaration’ (Exhibit A – Professional Biologist Qualification Declaration for Wetlands Reports) to self-certify that they have the qualifications and experience necessary to identify, map, and evaluate wetlands. The declaration must be signed and included in the wetlands report.

V. WETLANDS REPORT METHOD.

Wetlands reports must use the approach outlined below to identify wetlands, map their boundaries, and determine required setbacks.

The Department recommends using the 1987 U.S. Army Corps of Engineers (USACE) Wetlands Delineation Manual (1987 Corps Manual) and associated Regional Supplements as the technical basis for identifying and mapping wetlands for wetlands reports. Professional biologists should use their best professional judgement.

---

8 Regulatory changes and/or litigation may result in modification of the definition of wetlands and their delineation methods; it is contingent upon the qualified professional biologist to use the latest USACE regulatory guidance and documents available.
in applying the methods described in the 1987 Corps Manual and Regional Supplements and provide a rationale for any alternative methods used.

The three-parameter approach to wetlands identification (presence of all three of the following attributes: wetland vegetation, soils, and hydrology) must be used for all potential wetlands, except in the Coastal zone. In the Coastal zone, the one-parameter approach to wetlands identification (presence of one or more of the following attributes: wetland vegetation, soils, and hydrology) must be used.

A. Determine Study Area.

The study area must include the proposed new vineyard or orchard development area, vineyard or orchard redevelopment area, or agricultural grading or drainage alteration area, and any other areas that may be affected, plus a 100-foot buffer around those areas where feasible. The study area must be large enough to fully characterize all identified wetlands in or near the proposed new vineyard or orchard development area, vineyard or orchard redevelopment area, or agricultural grading or drainage alteration area.

B. Background Data Review.

Background data sufficient to use for determination of potential wetlands and mapping wetland boundaries should be reviewed. At a minimum, the following sources should be consulted during the background data review and presented in the report:

1. Wetland mapping database review (i.e., California EcoAtlas, National Wetland Mapping).
2. USGS 7.5 minute topographic map(s) or site-specific topographic survey, if available.
3. Current site plan.
4. Current general plan, local coastal program, and zoning code.
5. Current Sonoma County vegetation map.9
7. Current and historic aerial imagery, with dates referenced in report.
8. Soils maps.
10. Background research for any required biotic resource assessment.

A list of background review materials is set forth in the Wetland Background and Field Data Form Checklist (Exhibit B). The background data review portion of Exhibit B must be submitted with the report.

C. Field Survey Methods.

A field survey must be conducted for all wetlands reports. Field surveys may include a range of efforts based on the professional biologist’s best professional judgement and applicable agency protocols promulgated by those agencies with potential jurisdiction over waters of the U.S., including wetlands, waters of the State, and wetlands as defined pursuant to Coastal Act guidelines. At a minimum, these surveys should include vegetation mapping; application of the U.S. Army Corps of Engineers wetland survey protocols, which require an evaluation of soil, vegetation, and hydrology; and/or any other field surveys or data collection required to

---

9 http://www.sonomavegmap.org
Determine presence or absence of wetlands and wetland boundaries e.g., determination of Coastal Act wetlands.

D. Determine Setbacks.

Wetland setbacks must meet the setback requirements specified in Chapter 36, unless the wetlands report recommends an alternate setback, where and as permitted by Chapter 36 (see Table 1). If an alternate setback is recommended, the rationale for the alternate setback must be included in the wetlands report.

E. Minimum Wetland Identification and Mapping Methods.

1. Conduct field survey.
2. Document presence/absence of wetland vegetation, soils, and hydrology indicators and rationale for determinations.
3. Document potential wetlands and their boundaries.
4. Evaluate any significantly disturbed areas\(^\text{10}\) or naturally occurring “problematic” conditions that may affect wetland identification or mapping.\(^\text{11}\)
5. Map each wetland on an aerial photo map using data from the background data review and field survey or by using sub-meter GPS unit to collect data in the field, and mark the boundary of each wetland in the field using survey stakes or wire flags.
6. Map each wetland setback on an aerial photo map using data from the background data review and field survey or by using sub-meter GPS unit to collect data in the field, and mark the edge of each wetland setback in the field using survey stakes or wire flags.
7. Document the existing conditions within each wetland setback area, including vegetation types present and condition of vegetation, including any sparsely vegetated areas with poor existing vegetative cover.\(^\text{12}\)
8. Complete the Wetland Background and Field Data Form Checklist (Exhibit B).

VI. WETLANDS REPORT CONTENTS.

Wetlands reports must contain the following sections. Additional sections may be included, as deemed necessary or appropriate by the professional biologist preparing the report.

A. Cover Page.

1. Project name.
2. Applicant name and contact information.
3. Property owner, if different from applicant.
4. Physical address of the property, if applicable.
5. Assessor’s parcel number(s).
6. Names of all persons conducting field surveys and reconnaissance visits.
7. Survey/site visit dates.

\(^\text{10}\) Refer to the 1987 Manual and Regional Supplements and USACE guidance documents for additional information on significantly disturbed areas.

\(^\text{11}\) Refer to the 1987 Manual and Regional Supplements and USACE guidance documents for additional information on naturally problematic areas.

\(^\text{12}\) Refer to the Department’s Best Management Practices for Vineyard and Orchard New Planting and Replanting.
8. Date of report.

B. Physical and Biological Setting.

A description of the physical and biological resources in the study area and the potential for wetlands in the study area. At a minimum, the description must include:

1. Surface water flow and hydrology.
2. Any flood/drought conditions (and disturbed or problematic areas)\(^{13}\).

C. Results.

The results of the report. At a minimum, the results must include:

1. Results of the background data review, including any limitations.
2. Completed Wetland Background and Field Data Form Checklist (Exhibit B), including Table B-1, Rationale for Presence or Absence of Wetland Indicators, and Table B-2, Rationale for Setback Changes.
3. Discussion of wetland types and plant communities.
4. List of plant species observed (both scientific and common names and wetland plant indicator status\(^{14}\)).
5. Review of site hydrology, including any surface and subsurface sources, drainages, surface water connections, and any man-made water sources (such as irrigation) within the study area.
6. Description of soil conditions.
7. Wetland resources summary table, including wetland type, acreage, and location (Table 2 - Wetland Resources within the Study Area).
8. Discussion of any limits to the wetlands report (lack of access, other limits).
9. Rationale for not mapping any areas that may appear to support wetland vegetation or be saturated or ponded based on aerial imagery or site visits.
10. Description of wetland setbacks and setback areas, and rationale for any alternate setbacks.

\(^{13}\) See Footnotes 6 and 7.

</tr>
</tbody>
</table>

**D. Maps.**

The maps for the report. All maps must use the most recent imagery available and include project name, north arrow, bar scale and text scale, date and source of imagery, and current date. At a minimum, the maps must include:

1. An aerial photo map(s) identifying:
   a. Study area boundary;
   b. Extent of all wetlands; and
   c. Wetland setback areas.

2. A wetlands report map including:
   a. Site map showing the study area and proposed new vineyard or orchard development area, vineyard or orchard redevelopment area, or agricultural grading or drainage alteration area;
   b. Legend including area of wetland boundaries, sample points, photo points, and wetland and upland sample points (if any);
   c. Wetland boundaries and setbacks; and
   d. Appropriate landmark labels (roads, structures, topographic features).

**E. Photographs.**

The photographs for the report. The photographs must include:

1. Sufficient number of photographs to represent the study area.
2. Wetland photographs (minimum two for each wetland).
3. Wetland setback area photographs (minimum of two for each setback area).
4. Wetland or upland data points, if applicable.

F. References.

References for all documents and resources used and list of persons consulted for the report.

G. Electronic Version of Report and Maps.

Provide an electronic version of the wetlands report and all maps.

VII. RESOURCES.

PROJECT NAME:
NAME OF PROFESSIONAL BIOLOGIST:
FIRM:
CONTACT INFORMATION:

I am the professional biologist for the above-referenced project. I have the following minimum qualifications noted in the Department’s Guidelines for Preparing Wetlands Reports:

__________________________________________________________________________________
__________________________________________________________________________________
__________________________________________________________________________________

Please describe your education and professional experience related to general biological, botanical, wetland, soils, hydrology, or other areas of expertise as it pertains to wetland identification, mapping, and evaluation:

__________________________________________________________________________________
__________________________________________________________________________________
__________________________________________________________________________________

I have obtained the following wetland training (please check only those that apply):

Use of 1987 Corps of Engineers Wetlands Delineation Manual
Use of Regional Supplements to the 1987 Corps of Engineers Wetlands Delineation Manual (Western Mountains and Valleys and Coast Region and/or Arid West Region Manuals)
Advanced Wetland Delineation
Vegetation Identification for Wetlands/Wetland Botany
Advanced Hydric Soils/Problem Soils
Advanced Hydrology Indicators
Wetland Mapping
Problematic Wetland Delineation Methods
Wetland Restoration
Wetland Regulation
Other wetland training, please specify:
California Rapid Assessment Method, please specify training modules:
Other wetland monitoring and assessment methods, please specify:

Professional Wetland Delineation Certifications (check those that apply)

Society of Wetland Scientist Professional Wetland Scientist (PWS) Certification
organization: _______________________________________________________________________
Society of Wetland Scientist Wetland Professional in Training (WPIT)
____________________________________________________________________________________
Other Wetland Delineation Certification, please specify type of certification and
In addition to the wetland training specified above, I have previously conducted independent field work and reporting, and have demonstrated the following:

- Specific knowledge and experience in identification of habitats and vegetation associations found in Sonoma County, including wetland and riparian habitats;
- Specific knowledge of wetland plant, soils and hydrology indicators and methods used to evaluate wetland indicators;
- Specific knowledge of procedures and methods used to delineate wetlands;
- Specific knowledge and experience in mapping wetlands;
- Specific knowledge and experience in various regional, state, and federal regulations as they pertain to wetlands;
Specific knowledge and experience in identifying potential impacts to wetlands;
Specific knowledge and experience in recommending measures designed to minimize and avoid impacts to wetlands;
Specific knowledge and experience in writing complete, concise, and comprehensive technical reports following applicable manuals, guidance and procedure documents;
Specific knowledge and experience with the appropriate state and federal statutes, regulations, and procedures related to wetlands; and
Specific knowledge and experience with current state and federal wetland delineation guidance documents, guidelines, and manuals.

With my signature I confirm that I meet all the above qualifications and that the statements furnished in this wetlands report and associated maps are true and correct to the best of my knowledge.

</table>

1. The 1987 Corps Manual and Regional Supplements (or most current USACE methodology) should be used as the technical basis for determination of presence of wetland vegetation, soil and hydrology indicators, and potential wetlands.
Table B-2 Rationale for Setback Changes

Check all that apply or “none” for each category below. Any recommendations to reduce wetland setbacks from the setbacks specified in Chapter 36 (See Table 1) must confirm that there are no wetlands designated as Biotic Habitat Areas in the general plan or other “high” quality wetlands that have or support any of the high quality wetland conditions listed below.

A. **Wetlands Designated as Biotic Habitat Areas in the General Plan**
   - □ Wetlands designated as Biotic Habitat Areas in the general plan
   - OR
   - □ None - No wetlands designated as Biotic Habitat Areas in the general plan are present

B. **High Quality Wetland Conditions**
   - □ Threatened or Endangered Species or their habitat
   - □ Designated Critical Habitat
   - □ Significant breeding or concentration area for wildlife or rare plants/vegetation
   - □ High native plant or wildlife species diversity and abundance
   - □ Habitat lacking or with limited anthropogenic disturbances
   - □ Surrounding habitat that is undeveloped/unaltered
   - □ Other (describe) __________________________________________________________
   - OR
   - □ None - No high quality wetland conditions are present

C. **Moderate to Low Quality Wetland Conditions**
   - □ Sparse vegetation/limited vegetation cover (describe) ____________________________
   - □ Anthropogenic disturbances (describe) ________________________________________
   - □ High invasive plant species cover or dominance (list species and percent cover)____________________________
   - □ Habitat surrounding wetland intensely developed or highly altered (describe) __________________________
   - □ Other (describe) ____________________________________________________________________________
   - OR
   - □ None. No moderate to low quality wetland conditions are present.
Provide the rationale for any changes to the wetland setbacks specified in Chapter 36 (See Table 1). Recommendations for alternate setbacks must 1) describe the qualities and condition of the wetland setback area, and 2) provide the rationale for any differences using the conditions checked above under B. High Quality Wetland Conditions or C. Moderate to Low Quality Wetland Conditions

1. Description of wetland setback area:

2. Rationale for alternate setback:
I. PURPOSE.

To specify general guidelines for qualified professional biologists to prepare biotic resource assessments and focused species assessments for new vineyard and orchard development and vineyard and orchard redevelopment, as required by Chapter 36 of the Sonoma County Code\(^\text{15}\) (Sonoma County New Vineyard and Orchard Development, Vineyard and Orchard Redevelopment, and Agricultural Grading and Drainage Alteration Regulations).

II. REQUIREMENTS.

A biotic resource assessment is required for all new vineyard and orchard development, except where exempted from Chapter 36 permit requirements.

A focused species assessment is required for all vineyard and orchard redevelopment located in designated critical habitat areas, except where exempted from Chapter 36 permit requirements.

New vineyard and orchard development areas and vineyard and orchard redevelopment areas are required to be setback from lakes, ponds, reservoirs, and streams as set forth in Table 1 below.

Table 1. Lake, Pond, Reservoir, and Stream Setback Requirements

<table>
<thead>
<tr>
<th>Type of Waterbody</th>
<th>Setback for New Vineyard and Orchard Development Areas</th>
<th>Setback for Vineyard and Orchard Redevelopment Areas</th>
</tr>
</thead>
<tbody>
<tr>

III. PROCEDURE.

Biotic resource assessments and focused species assessments must be prepared by qualified professional biologists using the biotic resource identification and mapping methods and reporting standards included in these guidelines. Biotic resource assessments and focused species assessments shall identify any requirements or changes that must be incorporated into the design, layout, and/or construction of the proposed new vineyard or orchard development or vineyard or orchard redevelopment. Biotic resource assessments and focused species assessments are not environmental clearance documents for purposes of the California Environmental Quality Act.

Biotic resource assessments and focused species assessments must be submitted to the Department with the permit application. If a biotic resource assessment identifies potential wetland areas, a wetlands report must be included as an appendix to the assessment.

Biotic resource assessments and focused species assessments are valid for three years from the date of the assessment. Biotic resource assessments and focused species assessments older than three years must include an addendum from a professional biologist addressing any changed conditions in the study area or any newly identified special status species that may be present. If impacts to listed species are identified in a biotic resource assessment or focused species assessment, the Department may forward the permit application to appropriate state and federal resource agencies for review and consultation.
IV. PROFESSIONAL BIOLOGISTS QUALIFIED TO PREPARE.

Professional biologists preparing biotic resource assessments and focused species assessments must complete a ‘Declaration’ (Exhibit A – Professional Biologist Qualifications Declaration for Biotic Resource Assessments and Focused Species Assessments) to self-certify that they have the following qualifications:

1. Experience in the identification of habitats and vegetation associations found in Sonoma County.
2. Familiarity with local plant and animal species, including all listed species.
3. Familiarity with the critical and/or sensitive habitats within which listed species are likely to be found.
4. Familiarity with applicable state and federal statutes and procedures related to plant and animal surveys and collection.

The declaration must be signed and included in the biotic resource assessment or focused species assessment.

V. BIOTIC RESOURCE ASSESSMENT AND FOCUSED SPECIES ASSESSMENT METHODS.

Biotic resource assessments and focused species assessments must use the approach outlined below to identify biotic resources and listed species, identify any potential direct or indirect impacts to identified biotic resources and listed species, determine required setbacks, and recommend any avoidance and minimization requirements or other actions that must be implemented to avoid the take of listed species.

A. Determine Study Area.

The study area must include the proposed new vineyard or orchard development area or vineyard or orchard redevelopment area, and any other areas that may be directly or indirectly affected by the proposed new vineyard or orchard development or vineyard or orchard redevelopment, plus a 100-foot buffer around those areas where feasible. The study area must be large enough to fully characterize all identified biotic resources and listed species in or near the proposed new vineyard or orchard development area or vineyard or orchard redevelopment area.

B. Background Data Review.

Background data sufficient to use for determination of potential biotic resources and listed species should be reviewed. At a minimum, the following sources should be consulted during the background data review and presented in the assessment:

1. California Natural Diversity Database (CNDDB), ECOS, California Native Plant Society (CNPS), other reports, museum or herbarium records, etc.
2. USGS 7.5 minute topographic map(s) or site-specific topographic survey, if available.
3. Current site plan.
4. Current general plan, local coastal program, and zoning code.
5. Current Sonoma County vegetation map.\(^\text{16}\)
6. Current Sonoma County LiDAR data set.

\(^{16}\)http://www.sonomavegmap.org
DRAFT FOR PUBLIC REVIEW

7. Current and historic aerial imagery, with dates referenced in the Assessment.
8. Current U.S. Fish and Wildlife Service Information for Planning and Conservation (IPaC) and National Marine Fisheries Service (NMFS) species list for the study area.

C. Field Survey Methods

A field survey must be conducted for all biotic resource assessments and focused species assessments, unless the study area is well understood and justification is provided that the study area presents no issues with respect to listed species. Field surveys should be conducted in a manner that will locate the habitats of any listed species that may be present. It is the responsibility of the professional biologist to evaluate field conditions and determine the field work approach (Exhibit B – General Field Survey Protocol).

D. Determine Setbacks.

Lake, pond, reservoir, and stream setbacks must meet the setback requirements specified in Chapter 36, unless the biotic resource assessment or focused species assessment recommends an alternate setback, where and as permitted by Chapter 36 (See Table 1). If an alternate setback is recommended, the rationale for the alternate setback must be included in the biotic resource assessment or focused species assessment.

E. Minimum Lake, Pond, Reservoir, and Stream Mapping Methods

1. Conduct field survey.
2. Map each lake, pond, reservoir, and stream on an aerial photo map using data from the background data review and field survey or by using a sub-meter GPS unit to collect data in the field, and mark the high water mark or top of bank, as appropriate, of each waterbody in the field using survey stakes or wire flags.
3. Map each lake, pond, reservoir, and stream setback on an aerial photo map using data from the background data review and field survey or by using sub-meter GPS unit to collect data in the field, and mark the edge of each setback in the field using survey stakes or wire flags.
4. Document the existing conditions within each lake, pond, reservoir, and stream setback area, including vegetation types present and condition of vegetation, including any sparsely vegetated areas with poor existing vegetative cover.17

VI. Biotic Resource Assessment Contents

Biotic resource assessments must contain the following sections. Additional sections may be included, as deemed necessary or appropriate by the professional biologist preparing the assessment.

A. Cover Page.

1. Project name.
2. Applicant name and contact information.
3. Property owner, if different from applicant.

17 Refer to the Department’s Adopted Best Management Practices.
4. Physical address of the property, if applicable.
5. Assessor’s parcel number(s).
6. Names of all persons conducting field surveys and reconnaissance visits.
7. Survey/site visit dates.
8. Date of assessment.

B. Physical and Biological Setting.

A description of the physical and biological resources in the study area and the potential for occurrence of listed species in the study area. At a minimum, the description must include:

1. Local and project setting.
2. Topography.
3. Habitat.
4. Listed species.
5. Sensitive natural communities.
6. Vegetation.
7. Geology and soils.
8. Climate and hydrology.
9. Waterbodies.

C. Project Description.

A description of the proposed new vineyard or orchard development and the study area. At a minimum, the description must include:

1. The limits of the proposed new vineyard or orchard development area.
2. Any other areas that may be directly or indirectly affected.
3. Current site plan.

D. Results.

The results of the assessment. At a minimum, the results must include:

1. Results of the background data review, including any limitations.
2. Results of field surveys to locate the habitats of any listed species that may be present. If a field survey is not conducted because the study area is well understood and presents no issues with respect to listed species, explain how and why the study area is well understood and presents no issues with respect to listed species (Appendix B: Field Survey Methods).
3. Review of site hydrology, including both surface and subsurface sources, drainage gradients, and surface water connections.
4. Documentation of sensitive habitats or natural communities listed in the CNDDB search.
5. Documentation of plant communities and habitat types.
6. Documentation of listed species (Table 2: Listed Species, Natural Communities, and Habitat Potentially Occurring or Known to Occur).
7. Description of setbacks and setback areas, and rationale for any alternate setbacks.
8. Discussion of the direct and indirect impacts the proposed new vineyard or orchard development may have on listed species and/or their habitat.

9. Recommended avoidance and minimization requirements or other actions that must be implemented to avoid the take of listed species, if warranted.

Table 2. Listed Species, Natural Communities, Habitat Potentially Occurring or Known to Occur

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

E. Maps.

The maps for the assessment. All maps must use the most recent imagery available and include project name, north arrow, bar scale and text scale, date and source of imagery, legend, and current date. At a minimum, the maps must include:

1. Location map showing the physical address of the property.
2. Site map showing the study area and proposed new vineyard or orchard development area.
3. CNDDB species location map.
4. Aerial photo maps identifying:
   a. Study area boundary;
   b. Habitat;
   c. Lakes, ponds, and streams; and
   d. Setback areas.

F. Photographs.

The photographs for the assessment. At a minimum, the photographs must include:

1. Sufficient number of photographs to represent the study area.
2. Setback area photographs (minimum of two for each setback area).

G. Wetlands Appendix.

If the assessment addresses, maps, or makes recommendations regarding wetlands, a wetlands report must be included as an appendix to the assessment.
H. References.

References for all documents and resources used and list of persons consulted for the assessment.

I. Electronic Version of Assessment and Maps.

Provide an electronic version of the assessment and all maps.

VII. FOCUSED SPECIES ASSESSMENT CONTENTS.

Focused species assessments must contain the following sections. Additional sections may be included, as deemed necessary by the professional biologist preparing the assessment.

A. Cover Page.

1. Project name.
2. Applicant name and contact information.
3. Property owner, if different from applicant.
4. Physical address of the property, if applicable.
5. Assessor’s parcel number(s).
6. Names of all persons conducting field surveys and reconnaissance visits.
7. Survey/site visit dates.
8. Date of assessment.

B. Physical and Biological Setting.

A description of the physical and biological resources in the study area and the potential for occurrence of listed species in the study area. At a minimum, the description must include:

1. Local and project setting.
2. Topography.
3. Habitat.
4. Listed species.

C. Project Description.

A description of the proposed vineyard or orchard redevelopment and the study area. At a minimum, the description must include:

1. The limits of the proposed vineyard or orchard redevelopment area.
2. Any other areas that may be directly or indirectly affected.
3. Current site plan.

D. Results.

The results of the assessment. At a minimum, the results must include:

1. Results of the background data review, including any limitations.
2. Results of field surveys to locate habitat that may be present. If a field survey is not conducted because the study area is well understood and presents no issues with respect to listed species, the reasoning should be explained and include an explanation of how and why the study area is well understood (Appendix B: Field Survey Methods).
3. Description of setbacks and setback areas, and rationale for any alternate setbacks.
4. Discussion of the habitat affected by the proposed vineyard or orchard redevelopment, incorporating a description of the listed species and their habitat and current known range of the listed species.
5. Recommended avoidance and minimization requirements or other actions that must be implemented to avoid the take of listed species, if warranted.

E. Maps.

The maps for the assessment. All maps must use the most recent imagery available and include project name, north arrow, bar scale and text scale, date and source of imagery, legend, and current date. At a minimum, the maps must include:

1. Location map showing the physical address of the property.
2. Site map showing the study area and the proposed vineyard or orchard redevelopment area.
3. Aerial photo map(s) identifying:
   a. Study area boundary;
   b. Habitat;
   c. Lakes, ponds, and streams; and
   d. Setback areas.

F. Photographs.

The photographs for the assessment. At a minimum, the photographs must include:

1. Sufficient number of photographs to represent the study area.
2. Setback area photographs (minimum of two for each setback area).

G. References.

Reference for all documents and resources used and list of persons consulted.

H. Electronic Version of Assessment and Maps.

An electronic version of the assessment and all maps.

PROJECT NAME:

NAME OF PROFESSIONAL BIOLOGIST:

FIRM:

CONTACT INFORMATION:

I am the primary/lead field biologist for the above-referenced project. I have the following minimum qualifications noted in the Department’s Guidelines for Preparing Biotic Resource Assessments and Focused Species Assessments:

__________________________________________________________________________________________
__________________________________________________________________________________________
__________________________________________________________________________________________

Please describe your education and experience with regards to general botanical, wetland, and wildlife habitat as it pertains to biotic resource and/or focused species assessments:

__________________________________________________________________________________________
__________________________________________________________________________________________
__________________________________________________________________________________________

I have previously conducted independent field work and reporting, and have demonstrated the following:

  o Specific knowledge and experience in identification of habitats and vegetation associations found in Sonoma County;
  o Specific knowledge of local plant and animal species;
  o Specific knowledge and experience in identifying potential impacts to plants, animals, and habitats;
  o Specific knowledge and experience in recommending measures designed to minimize and avoid impacts to plants, animals, and habitats;
  o Specific knowledge and experience in monitoring for compliance with biological mitigation measures;
  o Specific knowledge and experience in writing complete, concise, and comprehensive technical reports following applicable survey protocols;
  o Specific knowledge and experience with the appropriate state and federal statutes, regulations, and procedures related to animal and plant surveys and collection; and
  o Specific knowledge and experience with current state and federal survey protocols, guidelines, and manuals required for the resource being evaluated.
With my signature I confirm that I meet all of the above qualifications and that the statements furnished in this biotic resource assessment/focused species assessment and associated maps are true and correct to the best of my knowledge.

Signature of Professional Biologist

Date
1. Conducted in the field using systematic field techniques in all habitats of the site. Ensure a thorough coverage of potential impact areas by conducting field surveys in all habitats as per standard biological techniques and federal and state protocols (as applicable) for identified listed species. More than one site visit may be required to evaluate all habitats during the appropriate season.

2. Plant survey should be floristic in nature\(^\text{18}\) and seasonably appropriate. Every plant observed shall be identified to the extent necessary to determine its listing status. In order to properly characterize the study area and document the completeness of the survey, a complete list of plants observed in the study area should be included. This information will help to support any conclusions that the species does or does not occur in the study area if they are not observed during the field surveys. More than one site visit may be necessary to capture the diversity of a study area. If potential habitat for endangered vernal pool plants is present, then field surveys to determine the presence or absence of these plants shall be conducted in a manner consisted with protocols developed by the U.S. Fish and Wildlife Service.

3. Conducted in a manner that is consistent with conservation ethics. Collections (voucher specimens) of listed species, or suspected listed species should be made only when such actions would not jeopardize the continued existence of the population and in accordance with applicable state and federal permit requirements.

Obtain necessary state and federal permits, collecting permits, and/or Memorandums of Understanding. Obtain necessary state and federal permits, collecting permits, and/or Memorandums of Understanding (MOUs) from the California Department of Fish & Wildlife (CDFW) or verify that your permits and MOUs are valid and up-to-date. Voucher specimens should be deposited at recognized public herbaria for future reference. Photography should be used to document plant identification and habitats whenever possible vs. collection of individuals, but especially when the population cannot withstand collection of voucher specimens.

4. Well documented. Consult the California Natural Diversity Database\(^\text{19}\) and Spotted Owl Observations Database Biogeographic Information and Observation System BIOS\(^\text{20}\) for known occurrences of listed species and natural communities in the project area prior to field surveys. When a listed species is located, a California Native Species (or Community) Field Survey Form accompanied by a copy of the appropriate portion of a 7.5 minute topographic map with the occurrence mapped and documented

---

\(^{18}\) Floristic in nature: Every plant taxon that occurs on site is identified to the taxonomic level necessary to determine rarity and listing status (CDFW, 2018)

\(^1\) Must be near perpendicular to fall line to qualify.

\(^2\) Terraces assumed to be cut or graded, not disked.
Agricultural Avenue. A seasonal road around or through a vineyard or orchard block, or an area at the end of a vine or tree row where vehicles and equipment can turn around.

Agricultural Commissioner. The agricultural commissioner-sealer of the county or his or her authorized representative.

Agricultural Drainage Alteration. Any drainage alteration to prepare new cropland or maintain existing cropland. Agricultural drainage alteration does not include drainage alteration for roads, dams, reservoirs, lakes, ponds, or structures.

Agricultural Drainage Alteration Area. The area subject to agricultural drainage alteration.

Agricultural Drainage Alteration Permit. See Section 36.10.010 of the code.

Agricultural Grading. Any grading to prepare new cropland or maintain existing cropland. Agricultural grading does not include grading for roads, dams, reservoirs, lakes, ponds, or structures.

Agricultural Grading Area. The area subject to agricultural grading.

Agricultural Grading Permit. See Section 36.08.01 of the code.

Agricultural Road. A year-round road that provides access to or connects vineyard or orchard blocks.

Agricultural Road Network. The Agricultural roads and avenues serving a vineyard or orchard.

Approved Plans and Specifications. Plans and specifications, including reports, material lists, estimates, maintenance agreements, and professional recommendations, approved by the agricultural commissioner pursuant to this chapter.

Architect. A person licensed by the state to practice architecture.

Area of Slope Instability. An area of soil or rock prone to mass wasting, including slides, falls, slumps, and flows.

As-Built Plans. Plans or drawings that depict the final installed configuration of new vineyard or orchard development, vineyard or orchard redevelopment, or agricultural grading or drainage alteration (whether physical or functional). The plans or drawings shall indicate any construction deviations and show all features as actually built. The plans or drawings are intended to provide a permanent record of as-built conditions and aid as key references for future maintenance processes.
Assessment. See Biotic Resource Assessment and Focused Species Assessment.

Best Management Practice. A program, technology, process, siting criteria, operational method, or engineered system, which when implemented prevents, controls, removes, or reduces pollution or other adverse environmental effects.

Biotic Resource Assessment. A report prepared by a qualified professional biologist in compliance with department guidelines to identify and document any biotic resources present on a site. The report must include the identification of potential direct or indirect impacts to listed species, aquatic resources, sensitive terrestrial habitats, and/or potential habitat suitable to support listed species. The report shall also document the location of required setbacks and recommend any avoidance and minimization requirements or other actions that must be implemented to avoid the take of listed species.

Blue-line Stream. A stream that appears as a broken or solid blue line (or a purple line) on a USGS topographic map.

California Environmental Quality Act (CEQA). Public Resources Code section 21000 et seq.

Civil Engineer. A person licensed by the state to practice civil engineering.

Commercial Orchard. Any orchard producing fruit or nuts for commercial purposes.

Contiguous vegetation. Vegetation that is physically touching or adjacent, and not separated by features like roads, developed land, or cropland.

County Land Use Approval. A discretionary permit or approval granted by the county pursuant to Chapter 25, 26, or 26C of this code.

Cropland. Land devoted to the production of agricultural crops.

Cut. See excavation.

Deep Ripping. The mechanical manipulation of the soil at depths greater than 16 inches to break up or pierce highly compacted, impermeable or slowly permeable subsurface soil layers, or other similar kinds of restrictive soil layers.

Department. The Department of Agriculture/Weights & Measures of the county.

Department’s Adopted Best Management Practices. The best management practices adopted or amended by the agricultural commissioner pursuant to Section 36.02.060.

Design Discharge. See the Flood Control Design Criteria Manual.
Designated Critical Habitat Area. The critical habitat for a listed species designated by the U.S. Fish and Wildlife Service or NOAA Fisheries pursuant to 16 U.S.C. § 1532(5).

Designated Watershed or Sub-Watershed. A watershed or sub-watershed designated in the general plan.

Discretionary Permit Application. A permit application that includes a request pursuant to Section 36.12.030.D for relief from the standards in Article 18.

Drainage. Refers to the collection, conveyance, containment, and/or discharge of stormwater runoff.

Drainage Alteration. Construction or modification of any drainage facility or system.

Drainage Facility. A constructed component of a drainage system.

Drainage System. Constructed and/or natural features that work together to collect, convey, channel, hold, inhibit, retain, detain, infiltrate, divert, treat, or filter stormwater runoff, including detention and retention basins, overland flow paths, pipes, channels, and the inlets and outlets to these features.

Earth Material. Any rock or natural soil or combination thereof.

Embankment. A fill consisting of a deposit of soil, rock, or other materials mechanically placed.

Engineered Agricultural Drainage Alteration. See Section 36.10.010.B.

Engineered Agricultural Grading. See Section 36.08.010.B and Table 36-3.

Erosion. The process by which soil particles are detached and transported by the actions of wind, water, or gravity.

Excavation. The removal of earth material by artificial means, also referred to as a cut.

Fill. The deposition of earth material by artificial means. Fill does not include soil amendment and fertilizing materials.

Final Level I New Development. The work undertaken as part of the final phase of Level I new development, including laying out of vineyard or orchard blocks and vine or tree rows, construction or modification of aboveground vineyard or orchard infrastructure, planting of grapevines or orchard trees, and other similar work.

Final Level I Redevelopment. The work undertaken as part of the final phase of Level I redevelopment, including laying out of vineyard or orchard blocks and vine or tree rows, construction or modification of aboveground vineyard or orchard infrastructure, planting of grapevines or orchard trees, and other similar work.

Final Level II New Development. The work undertaken as part of the final phase of Level II new development, including laying out of vineyard or orchard blocks and vine or tree rows, construction or modification of
aboveground vineyard or orchard infrastructure, planting of grapevines or orchard trees, and other similar work.

**Final Level II Redevelopment.** The work undertaken as part of the final phase of Level II redevelopment, including laying out of vineyard or orchard blocks and vine or tree rows, construction or modification of aboveground vineyard or orchard infrastructure, planting of grapevines or orchard trees, and other similar work.

**Flood-Prone Urban Area.** The area within the boundaries defined on the north by River Road; on the west by the easterly boundary of the Laguna de Santa Rosa to its intersection with Highway 12 and continuing with the easterly limit of the city of Sebastopol to Highway 116; on the south by Highway 116 to its intersection with Old Redwood Highway then south to East Cotati Avenue and east to its intersection with Petaluma Hill Road; and on the east by Petaluma Hill Road, north to Highway 12 then west to Highway 101 and north to River Road.

**Focused Species Assessment.** A report prepared by a qualified professional biologist in compliance with department guidelines to identify and document any habitat present on a site located in a designated critical habitat area. The report must include the identification of potential direct or indirect impacts to listed species, aquatic resources, sensitive terrestrial habitats, and/or potential habitat suitable to support listed species. The report shall also document the location of required setbacks and recommend any avoidance and minimization requirements or other actions that must be implemented to avoid the take of listed species.

**General Plan.** The Sonoma County General Plan.

**Geologic Hazard.** Slope instability, landsliding, fault displacement, liquefaction, flooding, subsidence, differential settlement, expansive soil, creeping soil, or other similar geologic condition, either mapped or observed in the field.

**Geologic Hazard Area Combining District.** See Article 70 of Chapter 26 and Article XXV of Chapter 26C of this code.

**Geologic Report.** A report prepared by a qualified professional geologist in compliance with department guidelines to be utilized in the planning, design, construction, and maintenance of new vineyard or orchard development or vineyard or orchard redevelopment.

**Geotechnical/Soils Report.** A report prepared by a qualified civil engineer in compliance with department guidelines to be utilized in the planning, design, construction, and maintenance of engineered agricultural grading.

**Grading.** An excavation or fill or combination thereof. Grading does not include routine farming practices, such as soil preparation, planting, seeding, and other similar activities.
Grapevine. A perennial grape-bearing vine.

Ground Disturbance. Any activity that disturbs or compacts the ground.

Hobby Orchard. Any orchard producing fruit or nuts for non-commercial hobby purposes.

Hobby Vineyard. Any vineyard producing wine grapes for non-commercial hobby purposes.

Initial Level I New Development. The work undertaken as part of the initial phase of Level I new development, including land clearing, vegetation removal, soil preparation, agricultural grading, construction or modification of vineyard or orchard infrastructure, and other similar work.

Initial Level I Redevelopment. The work undertaken as part of the initial phase of Level I redevelopment, including land clearing, vegetation removal, soil preparation, agricultural grading, construction or modification of vineyard or orchard infrastructure, and other similar work.

Initial Level II New Development. The work undertaken as part of the initial phase of Level II new development, including land clearing, vegetation removal, soil preparation, agricultural grading, construction or modification of vineyard or orchard infrastructure, and other similar work.

Initial Level II Redevelopment. The work undertaken as part of the initial phase of Level II redevelopment, including land clearing, vegetation removal, soil preparation, agricultural grading, construction or modification of vineyard or orchard infrastructure, and other similar work.

Invasive Plant Species. A plant species that has a rating of moderate or higher level of invasiveness on the most recent California Invasive Plant Council Invasive Plant Inventory. Examples of invasive plants include Himalayan blackberry (Rubus armeniacus), giant reed (Arundo donax), salt cedar (Tamarix sp.) and star thistle (Centaurea solstitialis).

Irrigation System. Equipment and facilities installed to apply water for irrigation and frost protection, including water source, water distribution network, control components, emission devices, and other irrigation equipment.

Key. A compacted fill placed in a trench excavated in earth material beneath the toe of a slope.

Lake. A permanent natural body of water, or an artificially impounded body of water, isolated from the sea, with at least one acre of open water of sufficient depth and permanency to prevent complete coverage by rooted aquatic plants.

Land Clearing. The removal of trees, stumps, brush, rocks, and other obstacles from an area, including removal of grapevines and orchard trees.

Landscape Architect. A person licensed by the state to practice landscape architecture.
Level I New Development. See Section 36.04.010.B and Table 36-1 of the code.

Level I Redevelopment. See Section 36.06.010.B and Table 36-2 of the code.

Level II New Development. See Section 36.04.010.B and Table 36-1 of the code.

Level II Redevelopment. See Section 36.06.010.B and Table 36-2 of the code.

Licensed Professional. An architect, civil engineer, landscape architect, professional forester, or professional geologist.

Listed Species. Any plant or animal species protected by the federal Endangered Species Act of 1973 (16 U.S.C. § 1531 et seq.) or the state Fish and Game Code.

Ministerial Permit Application. A permit application that does not include a request pursuant to Section 36.12.030.D for relief from the standards in Article 18.

MS4 Permit. A Municipal Separate Storm Sewer Systems National Pollutant Discharge Elimination System Permit.

New Orchard Development. The planting of a new orchard, increasing the footprint of an existing orchard, or replanting of all or part of an existing orchard that does not qualify as orchard redevelopment.

New Orchard Development Area. The area subject to any ground disturbance related to new orchard development, including the new planting area, agricultural road network and other orchard infrastructure, staging areas for vehicles, supplies, and equipment, and material storage areas.

New Planting Area. The area subject to new vineyard or orchard development.

New Vineyard and Orchard Development Permit. See Section 36.04.010 of the code.

New Vineyard Development. The planting of a new vineyard, increasing the footprint of an existing vineyard, or replanting of all or part of an existing vineyard that does not qualify as vineyard redevelopment.

New Vineyard Development Area. The area subject to any ground disturbance related to new vineyard development, including the new planting area, agricultural road network and other vineyard infrastructure, staging areas for vehicles, supplies, and equipment, and material storage areas.

Non-Cohesive Soil. Soil where the particle size of the smaller than 2 mm fraction of the soil is coarser than Loam as defined by the Natural Resources Conservation Service soil texture classification scheme.

Orchard. A planting of orchard trees. Land devoted to the cultivation of such a planting.

Orchard Infrastructure. The agricultural road network, equipment turnarounds, drainage system, irrigation system, and other basic facilities and systems needed for the operation of an orchard.

Orchard Redevelopment. The replanting of all or part of an existing orchard where the orchard is under active cultivation, no orchard trees are removed prior to the issuance of a vineyard and orchard redevelopment...
permit, unless the replanting is exempt from permit requirements, and the footprint of the area to be replanted is not increased.

**Orchard Redevelopment Area.** The area subject to any ground disturbance related to orchard redevelopment, including the replanting area, agricultural road network and other orchard infrastructure, staging areas for vehicles, supplies, and equipment, and material storage areas.

**Orchard Tree.** A fruit- or nut-bearing tree.

**Permit Application.** An application for a permit required by this chapter.

**Permit Holder.** The owner of the site. See Section 36.14.020.C.

**Permittee.** The permit holder or an authorized agent of the permit holder.

**Person.** Any individual, firm, partnership, corporation, company, association, joint stock association; city, county, state, or district; tribe; and includes any trustee, receiver, assignee, or other similar representative thereof.

**Pit.** An earthen excavation designed to store water.

**Pond.** A body of still freshwater smaller than a lake, often artificially impounded.

**Professional Biologist.** A person possessing academic and professional experience in biological sciences and related resource management activities who is able to identify biotic resources and can recognize and is familiar with the habitats and behaviors of listed species that may be present in the county. The person must have specialized skills and training and any required licenses/permits/certifications specific to the study being conducted (e.g., general botany and plant ecology, wetland ecology and delineation, and wildlife habitat knowledge for biotic resource assessments and focused species assessments, wetland ecology and delineation for wetlands reports, applicable permits to handle special status species for presence/absence surveys).

**Professional Forester.** A person licensed by the state to practice forestry.

**Professional Geologist.** A person licensed by the state to practice geology.

**Public Agency.** Any state or federal agency, any city, county, or special district.

**Qualifying Rain Event.** Any weather pattern that is forecasted by the National Weather Service to have a 50 percent or greater chance of producing 0.5 inches or more precipitation on a site within a 48 hour or greater period between rain events.

**Rain Event.** Any weather pattern producing precipitation.

**Rainy Season.** The period of the year during which there is a substantial chance of precipitation. For the purposes of this chapter, the rainy season is defined as starting on October 1 and ending on April 30.
Registered Environmental Health Specialist. A person licensed by the state to practice as an environmental health specialist.

Regular Agricultural Grading. See Section 36.08.010.B and Table 36-3 of the code.

Replanting Area. The area subject to a vineyard or orchard redevelopment.

Reservoir. A water storage structure made by constructing a dam, embankment, or pit with an impermeable liner such as clay or synthetic material.

Ridgetop. A relatively flat topographic divide above divergent and descending slopes where one or more of the descending slopes has a slope greater than 50 percent for more than 50 feet in slope length.

Santa Rosa Plain Groundwater Subbasin. The Santa Rosa Plain Groundwater Subbasin, as designated by the California Department of Water Resources in Bulletin 118 (Groundwater Basin No. 1-55.01).

Sediment. Solid particulate matter, both mineral and organic, that is in suspension, is being transported, or has been moved from its site of origin by air, water, gravity, or ice and has come to rest on the earth's surface either above or below sea level.

Setback Area. The area within a setback required by Section 36.18.090, 36.18.100, 36.18.110, 36.18.120, or 36.18.130 of the code.

Site. All or part(s) of a parcel or adjoining parcels under single ownership or control where new vineyard or orchard development, vineyard or orchard redevelopment, or agricultural grading or drainage alteration is performed or permitted.

Slope. An inclined surface, the inclination of which is expressed as a ratio of horizontal distance to vertical distance (e.g., 2:1) or as a percentage (e.g., 50 percent). Slope shall be calculated using a method acceptable to the agricultural commissioner.

Soil Amendment and Fertilizing Materials. Organic and in-organic substances applied to the existing soil to improve physical properties of the soil or increase available nutrients in the soil. Soil amendment and fertilizing materials include commercial fertilizers, agricultural minerals such as gypsum and lime, pumice, straw, and manure.

Soil Preparation. Deep ripping, chisel plowing, field cultivating, diskng, plowing, harrowing, cultipacking, rototilling, application of soil amendment and fertilizing materials, and other similar activities.

State CEQA Guidelines. California Code of Regulations, title 14, section 15000 et seq.

Stormwater Runoff. Surface runoff generated by a rain event.

Stream. Any natural or modified channel with bed and banks containing flowing water or showing evidence of having contained flowing water, such as deposit of rock, sand, gravel, or soil. Stream includes creeks and rivers.
**Surface Runoff.** Any water that flows over the land surface.

**Terrace.** A relatively level step constructed in the face of a graded slope for drainage and maintenance purposes.

**Tree.** A woody perennial plant, typically large with a well-defined stem carrying a definite crown, with a minimum diameter at breast height of five inches, and a minimum height of 15 feet.

**Tree Removal.** The removal of more than one-half acre of tree canopy within a new planting area.

**Tree Canopy.** The more or less continuous cover of branches formed by the crowns of adjacent trees other than orchard trees.

**Trellis System.** Structures put in place to support and train grapevines in vine rows, including end posts, T-posts, wire, and other trellis materials.

**Tribe.** A California Native American tribe that is on the contact list maintained by the Native American Heritage Commission.

**Vegetation.** All natural, non-cultivated plant life, including the root system, stem, trunk, crown, branches, leaves, and blades.

**Vegetation Removal.** The cutting, breaking, burning, or uprooting of vegetation, the application of herbicide to vegetation, the covering over of vegetation with earth, or the compacting of the soil under and around vegetation. Vegetation removal does not include removal of invasive plant species.

**Vineyard.** A planting of grapevines. Land devoted to the cultivation of such a planting.

**Vineyard Infrastructure.** The agricultural road network, equipment turnarounds, drainage system, irrigation system, trellis system, and other basic facilities and systems needed for the operation of a vineyard.

**Vineyard and Orchard Redevelopment Permit.** See Section 36.06.010 of the code.

**Vineyard Redevelopment.** The replanting of all or part of an existing vineyard where the vineyard is under active cultivation, no grapevines are removed prior to the issuance of a vineyard and orchard redevelopment permit, unless the replanting is exempt from permit requirements, and the footprint of the area to be replanted is not increased.

**Vineyard Redevelopment Area.** The area subject to any ground disturbance related to vineyard redevelopment, including the replanting area, agricultural road network and other vineyard infrastructure, staging areas for vehicles, supplies, and equipment, and material storage areas.

**Wetlands.** Those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.
DRAFT FOR PUBLIC REVIEW

Wetlands Report. A report prepared by a qualified professional biologist in compliance with department guidelines to determine and document the location of wetlands on a site, including mapping the wetlands and required setbacks.

Zoning Code. Chapters 26 and 26C of the code.
APPENDIX 8

New Vineyard and Orchard Development and Vineyard and Orchard Redevelopment Notes

1. All work shall be performed in compliance with the approved plans and specifications. The approved plans and specifications shall not be changed without the written approval of the agricultural commissioner. Proposed modifications to the approved plans and specifications shall be submitted to the agricultural commissioner in writing, together with all necessary technical information and design details. The contractor shall immediately notify the property owner and engineer of record, if applicable, upon discovering discrepancies, errors, or omissions in the approved plans. Prior to proceeding, the property owner shall have the approved plans revised to clarify identified discrepancies, errors, or omissions. The agricultural commissioner may require unauthorized work to be redone or removed to verify compliance with Chapter 36 of the Sonoma County Code (code). The agricultural commissioner may initiate enforcement action and seek the imposition of civil penalties for violations of code.

2. Prior to the start of any new vineyard and orchard development, vineyard and orchard redevelopment, or agricultural grading or drainage alteration work, the permittee shall have a pre-construction consultation with the agricultural commissioner.

3. The permittee shall notify the agricultural commissioner of any change in ownership of the site prior to completion of the work.

4. The work shall be subject to inspection as required by the agricultural commissioner. The permittee shall provide adequate access to the site for inspection by inspectors designated by the agricultural commissioner during the performance of all work and for a minimum of three years after final inspection.

5. The agricultural commissioner may require professional inspections and certifications to verify proper completion of the work. Where the use of professional personnel is required, these personnel shall immediately report in writing to the agricultural commissioner and the permittee any instance of work not in compliance with Chapter 36 of the code, and other applicable provisions of the code, the approved plans and specifications, or any permit conditions, and shall also provide recommendations for corrective measures, if determined by the professional to be necessary. If professional personnel is changed during the course of the work, the work shall be stopped until the replacement individual notifies the agricultural commissioner in writing of the change of professional and the new professional notifies the agricultural commissioner in writing of their agreement to accept responsibility for approval of the completed work within the area of their technical competence.

6. The permittee shall contact the Underground Service Alert (USA) prior to starting any excavation that will be conducted in an area that is known, or reasonably should be known, to contain subsurface
utility installations. Contact shall occur at least two working days, but not more than fourteen calendar
days before the excavation starts.

7. The agricultural commissioner shall not give final approval until a final inspection of the work has been
completed and approved by the agricultural commissioner and all work has been completed in
compliance with the approved plans and specifications, and following plans and reports that the
agricultural commissioner may require, supplements thereto, or other documentation, prepared by
the appropriate professionals in the format required by the agricultural commissioner: as-built plans,
testing records, and declarations about completed work. The agricultural commissioner may also
require such plans and reports at other stages of the work.

8. In the event cultural resources (such as historical, archaeological, and paleontological resources)
and/or human remains are discovered during grading or other construction activities, work shall
immediately be halted within the vicinity of the find, the agricultural commissioner shall be notified,
and the following shall occur before work may be resumed:
   o The Northwest Information Center shall be notified at (707) 588-8455.
   o A qualified archeologist shall be consulted for an on-site evaluation. Additional mitigation may
     be required by the County per the archeologist’s recommendations and Section 11.16.050 of
     the code.
   o If human burials or human remains are encountered, the contractor shall also notify the
     County Coroner at (707) 565-5070.

9. New vineyard and orchard development, vineyard and orchard redevelopment, and agricultural
grading and drainage alteration shall not remove or disturb trees and other vegetation except in
compliance with the approved plans and specifications. The limits of work-related ground disturbance
shall be clearly identified and delineated on the approved plans and specifications and defined and
marked on the site to prevent damage to surrounding trees and other vegetation. Trees and other
vegetation within the limits of work-related ground disturbance that are to be retained shall be
identified and protected from damage by marking, fencing, or other measures.

10. New vineyard and orchard development, vineyard and orchard redevelopment, and agricultural
grading and drainage alteration shall prevent or control soil and other pollutant discharges during
qualifying rain events by implementing erosion prevention or control measures detailed on the
approved project plans at least 48 hours prior to any qualifying rain event, unless the site has been
winterized pursuant to Section 36.18.160 of the code.

11. Initial Level I new development shall be permitted from October 1 to November 14 and April 1 to April
30 when on-site soil conditions permit the work to be performed in compliance Article 18 of Chapter
36 of the code and sufficient materials are available on-site to implement the erosion prevention or
control measures required by Section 36.18.130.B of the code, if necessary. Initial Level I new
development shall be prohibited from November 15 to March 31, except for emergency work to
protect life or property, or to implement erosion prevention or control measures.
12. Initial Level II new development shall be permitted from October 1 to October 14 and April 1 to April 30 when on-site soil conditions permit the work to be performed in compliance with Article 18 of Chapter 36 of the code and sufficient materials are available on-site to implement the erosion prevention or control measures required by Section 36.18.130.B of the code, if necessary. Initial Level II new development shall be prohibited from October 15 to March 31, except for emergency work to protect life or property, or to implement erosion prevention or control measures.

13. Final Level I and Level II new development shall be permitted during the rainy season when on-site soil conditions permit the work to be performed in compliance with Article 18 of Chapter 36 of the code and sufficient materials are available on-site to implement the erosion prevention or control measures required by Section 36.18.130.B of the code, if necessary.

14. Initial Level I and Level II redevelopment shall be permitted from October 1 to November 14 and April 1 to April 30 when on-site soil conditions permit the work to be performed in compliance with Article 18 of Chapter 36 of the code and sufficient materials are available on-site to implement the erosion prevention or control measures required by Section 36.18.130.B of the code, if necessary. Initial Level II redevelopment shall be prohibited from November 15 to March 31, except for emergency work to protect life or property, or to implement erosion prevention or control measures.

15. Final Level I and Level II redevelopment shall be permitted during the rainy season when on-site soil conditions permit the work to be performed in compliance with Article 18 of Chapter 36 of the code and sufficient materials are available on-site to implement the erosion prevention or control measures required by Section 36.18.130.B of the code, if necessary.

16. New vineyard and orchard development, vineyard and orchard redevelopment, and agricultural grading and drainage alteration sites shall be winterized in compliance with Section 36.18.150 of the code and the approved plans and specifications each year until the vineyard and orchard development or agricultural grading or drainage permit is finalized. A cover crop detailed on the approved plans and specifications shall be either established on all disturbed surfaces by October 15 for Level II new development or November 15 for Level II redevelopment and agricultural grading and drainage; or planted and straw mulch applied at the rate of 2 tons per acre on all disturbed surfaces by the specified installation date. After installation, cover crops shall be maintained through March 31.

17. The permittee shall submit a declaration to the Agricultural Commissioner within 15 days following the installation date specified for winterization each year until the new vineyard and orchard development, vineyard and orchard redevelopment, or agricultural grading or drainage alteration permit is finalized certifying that winterization measures have been properly installed on the site in accordance with the approved plans and specifications.
Agricultural Grading and Drainage Notes

1. Perform agricultural grading and drainage alteration improvements in accordance with Chapter 36 of the Sonoma County code (code), applicable Sonoma County regulations and, if applicable, to the recommendations of the geotechnical/soils report prepared by ____________________________ and dated ___/___/______.

2. The agricultural grading or drainage alteration permit and a copy of the approved plans shall be maintained on the project site throughout the duration of construction activities.

3. The agricultural commissioner may order that any work stop immediately if it is performed contrary to Chapter 36 of the code, the approved plans and specifications, permit conditions, or any work that has become hazardous to property or the public.

4. Issuance of an agricultural grading or drainage alteration permit by the agricultural commissioner does not eliminate the responsibility of the property owner to secure permits from other agencies with regulatory responsibilities for the uses and construction activities associated with the work shown on the approved plans. Failure to obtain all required permits may result in fines from other agencies.

5. Agricultural grading shall be limited to the agricultural grading area identified and delineated on the approved plans and specifications.

6. Agricultural Grading and drainage alteration improvements shall be set back from lakes, ponds, reservoirs, streams, and wetlands in compliance with the requirements of Sections 36.18.090 – 36.18.120 of the code. No heavy equipment or work-related ground disturbance shall be allowed in any setback area without approved permits.

7. Should agricultural grading operations encounter hazardous materials, or what appear to be hazardous materials, stop work immediately in the contaminated area and contact 911 or the appropriate agency for further instruction.

8. Contours, elevations, and shapes of finished surfaces shall be blended with adjacent natural terrain to achieve a consistent grade and natural appearance. Borders of cut slopes and fill shall be rounded off to a minimum radius of 5 feet to blend with the natural terrain.

9. Ground surfaces shall be prepared to receive fill by removing vegetation, topsoil, and other unsuitable materials, and scarifying the ground to provide a bond with the fill material.

10. Fill material shall not include organic, frozen, or other deleterious materials. No rock or similar irreducible material greater than 6 inches in any dimension shall be included in fills, except where a civil engineer devises a method of placement of larger rock, continuously inspected its placement, and
approves fill stability. Potential rock disposal areas shall be shown on the plans and specifications. Rocks shall be placed so as to ensure filling of all voids with well-graded soil.

11. Fills shall be constructed in lifts not exceeding 8 inches in depth. Completed fills shall be stable, well-integrated, and bonded to adjacent materials and the materials on which they rest. Fills shall be competent to support anticipated loads and be stable at the design slopes shown on the approved plans and specifications.

12. Fills below 30 inches from finished grade shall be compacted to a minimum of 90 percent of maximum dry density, as determined by ASTM D 1557, Modified Proctor, or as specified by a civil engineer.

13. Fill at or above 30 inches from finished grade shall be compacted to a minimum density necessary for the intended use or as specified by a civil engineer.

14. Footings that may be affected by any excavation shall be underpinned or otherwise protected against settlement and shall be protected against lateral movement. Fills or other surcharge loads shall not be placed adjacent to any building or structure unless the building or structure is capable of withstanding the additional loads caused by the fill or surcharge. The rights of adjacent affected property owners shall be as set forth in Civil Code section 832.

15. Agricultural grading and drainage alteration shall be permitted from October 1 to November 14 and April 1 to April 30 when on-site soil conditions permit the work to be performed in compliance Article 18 of Chapter 36 of the code and sufficient materials are available on-site to implement the erosion prevention or control measures required by Section 36.18.130.B of the code, if necessary. Agricultural grading and drainage alteration shall be prohibited between November 15 and March 31, except for emergency work to protect life or property, or to implement erosion prevention or control measures.

**Biological and/or Botanical Notes**

1. All setbacks required by Article 18 of Chapter 36 the Sonoma County Code (code) and any technical reports shall be marked in the field prior to construction.
